[a] Per the Appointed Actuary's Report as at February 28, 2018

[b] Ultimate Incurred Claims / Number of HTA Units by respective coverage

[c] Based on the 'Indicated Exponential Trend' by respective coverage rounded up to the nearest 0.25%; minimum 0.00%

[d] Based on the 'Indicated Exponential Trend - All Years' by respective coverage

TABLE 8

The following charts present the regression of the pure premiums by coverage. The charts show the actual pure premiums as well as the fitted line using the same number of years as was used to determine the selected trends.

A trend, by coverage, was selected based on the data available. For all coverages except Collision, we have selected the longer term trend i.e. the indicated exponential trend for pure premiums for all years. In general, these coverages exhibit low R-squared statistics regardless of whether the trend is calculated using all years or the 10 most recent years. Additionally, for Accident Benefits coverages – AB Other (Indexed), AB Other (Non-Indexed) and Income Replacement Indemnity – the longer term trend is a better representation of the actual trend given the significant fluctuations in claims costs.

For Collision, we have selected the indicated exponential trend for pure premiums for the 10 most recent years. The R-squared statistic for the 10 most recent years is high at 0.90, and the use of a more recent trend better reflects the trend going forward.

Further details of the selected trends are presented in RM.4.3 Major Classification Required Rates, consideration (vi).

Appendix 10: REQUIRED RATE COMPARISON

Figure 1 presents the components of the required rate as filed for the 2019 GRA compared to the corresponding figures from the 2018 GRA based on PUB Order 130/17. Two sets of figures are presented for rating year 2019/20. The first set uses the same interest rate (of 3.82%) that was used to determine the required rate for rating year 2018/19 based on PUB Order 130/17. This allows for a comparison that is not influenced by changes in the interest rate. The second set uses the actual projected interest rate (of 3.21%) that was used to determine the required rate for rating year 2019/20 as filed in the 2019 GRA.

Figure 1: Comparison of the Components of the Required Rate

Line No.	Components	2018/19 [a]	2019/20 Prior I/R [b]	Variance	2019/20 Rev I/R [c]	I/R Impact

28	Required Rate (= Claims + Expenditures - Other Income Sources)	898.04	907.89	9.85	916.22	8.33

29 Notes:
30 [a] Per PUB Order 130/17
31 [b] Based on interest rate of 3.82% i.e. the same interest rate used to derive
32 the 2018/19 required rate per PUB Order 130/17
33 [c] Based on interest rate of 3.21% i.e. the interest rate used to derive the
34 2019/20 required rate as filed in the 2019 GRA

1 The increase in claims costs is driven primarily by the increase in Collision claims costs
2 of $21.21 or 5.4%. This is offset partially by a decrease in Comprehensive claims
3 costs of $8.23 or 8.4%. Total PIPP claims costs (Accident Benefits - Other and Income
4 Replacement Indemnity) increased marginally by $0.53 or 0.3%.

5 Per *Part V(i) Claims Incurred, page 40*, Collision ultimate claims costs (by accident
6 year) are forecasted to increase by approximately 7.1% annually, implying a 5.5%

increase in the per unit cost (based on forecasted volume growth of 1.5%). The 5.5% increase is driven mainly by the projected increase in collision severity of 5.4% annually. Further details of the Collision claims costs forecast are provided in *Part V(i) Claims Incurred CI.9*.

For Comprehensive, per *Part V(i) Claims Incurred, page 66*, the forecasted ultimate claim costs (by accident year) for the current year is lower than last year by approximately 12.0%. This is driven primarily by lower expected severity for hail claims as a result of the Paintless Dent Repair program. Further details of the Comprehensive claims costs forecast are provided in *Part V(i) Claims Incurred, CI.10*.

Per unit costs for expenditures decreased by $4.41 or 1.5%, most of which is driven by decreases in claims and operating expense. Total per unit costs increased by $8.33 or 0.9% as a result of the change in projected interest rate from 3.82% to 3.21%.

RATE SETTING FRAMEWORK

Manitoba Public Insurance (MPI or the Corporation) has developed this General Rate Application in accordance with a rate setting framework that reflects established corporate goals, Accepted Actuarial Practice (AAP), and directions from the Public Utilities Board (PUB). The application of this framework ensures that the overall rate indication is reasonable and appropriate.

RSF.1 CORPORATE GOALS

The following two corporate goals provide the framework with which Basic Autopac rates are established:

- Universally available mandatory protection against the cost of automobile accidents. Rates, on average, will be lower than those charged by private insurance companies for comparable coverage and service.
- Total Equity will be maintained within established target levels.

Having stable overall rates, using rating approaches that are based on actuarial principles, following accepted industry practice for risk classification, and applying these in a consistent fashion ensures that these goals, from a rate setting perspective, are met.

The measures and strategies for achieving these goals are located in *Part VIII AR Annual Report*.

RSF.2 RATING APPROACHES

This section describes the rating principles, techniques, and approaches used by MPI in the calculation of Basic rates, following AAP.

RSF.2.1 Actuarial Principles

MPI's rating approach is based on actuarial principles that:

- Tie rates directly to costs
- Minimize cross subsidization between customers
- Provide for rates that are responsive to changes in claim patterns
- Ensure complete enumeration of all expected costs
- Achieve a 'break-even profit' on newly issued policies
- Maintain capitalization within regulatory capital targets though the equitable collection from customers such that the Basic capital position as measured by the Minimum Capital Test (MCT) does not deteriorate from the beginning of the rating period to the end (i.e. the net capital maintenance provision)

RSF.2.2 Risk Classification

MPI's rating approach uses four easy to apply categories that are consistent with normal industry practices. These categories are:

- Location
- Use of the vehicle
- Type of vehicle
- Driving record

All these categories of risk classification, except the use of the vehicle, are populated directly by MPI. For example, MPI maintains a database containing all information

pertaining to the driving records of its customers. The only information required from customers is the vehicle use and any change in address.

Balancing this simplicity and ease of understanding is the need to ensure equity of rates paid. By utilizing different dimensions unique to the risk arising from location, use of the vehicle, type of vehicle and driving record, MPI is able to ensure that different risks pay different rates, and that similar risks pay similar rates.

Detailed information on risk classification can be found in *Part V(ii) Driver Classification System* and *Part V(ii) Vehicle Classification System*.

RSF.2.3 Consistent Techniques and Approaches

To ensure stability of rates, improvements are adopted on an incremental basis to the rate setting rules as necessary.

Complementing this is the use of underlying statistical data. MPI uses the data as reported in its claims database in a structured and consistent manner each year.

RSF.2.4 Allocation of Loss Costs

Collision and comprehensive (hail, vandalism etc.) claims are applied on a first party basis (100% of losses are allocated to the vehicle incurring the loss), with the exception of motorcycles.

As per PUB Order 156/06, for motorcycle collision claims, 100% of motorcycle loss costs from single vehicle claims and 50% of motorcycle loss costs from multi-vehicle claims are allocated to motorcycles. The balance of the motorcycle loss costs are allocated to all other *Highway Traffic Act* units.

There is no allocation for motorcycle comprehensive claims because comprehensive coverage is not included in the Basic plan.

The Personal Injury Protection Plan (PIPP) costs are allocated in accordance with PUB Order 97/05 and modifications thereto, which are included in PUB Order 122/10.

RSF.2.5 PUB Order 97/05

PUB Order 97/05 established the following loss allocation rules:

1. In any accident involving only MPI-insured vehicles (one or more) and no other injured party, total PIPP costs are to be allocated equally (per vehicle) across the rating categories to which those vehicles belong; and

2. In any accident involving one or more MPI-insured vehicles and (i) one or more unidentified hit-and-run offenders, or (ii) another injured party or parties (including cyclists, pedestrians, and occupant(s) of out-of-province vehicles), 50% of total PIPP costs are to be allocated equally (per MPI-insured vehicle) across the rating categories to which the MPI-insured vehicles belong, and 50% of total PIPP costs are to be effectively allocated across all vehicle rating categories.

RSF.2.6 PUB Order 122/10

PUB Order 122/10 varied the loss allocation rules established in PUB Order 97/05 for single vehicle accidents involving pedestrians and cyclists, to include wildlife/livestock related accidents.

RSF.3 RATE SETTING PROCESS

The rate setting process is a combination of forecasting, financial modeling, ratemaking, and rate modeling, as described below.

RSF.3.1 Forecasting

To determine the required rates for the 2019/20 policy year, MPI forecasts the expected costs and revenues from all sources.

RSF.3.1.1 Claims Forecast

The expected costs associated with settling claims that will occur in the rating period are forecasted.

Key indicators used to forecast claims costs include:

- Reported-to-date and estimated final (i.e. ultimate) settlement cost of claims
- Projected changes in claims frequency i.e. claims count per vehicle e.g. increases in hail frequency and reductions in theft frequency
- Projected changes in claims severity i.e. claims costs per claim e.g. inflation, average cost or number of parts, industrial average wage, and negotiated increases in labour rates
- Change in vehicle population:
    - Projected growth in the vehicle volume – increased claims count and claims costs due to a larger number of vehicles in the fleet
    - Projected vehicle upgrade – increased claims severity due to customers buying newer/more expensive vehicles
- The projected interest rates on MPI's Basic fixed income portfolio, which are used as the basis for discounting claims liabilities and for determination of new money rates for rate setting purposes.

Detailed information on the claims forecasting process can be found in *Part V(i) Claims Incurred*.

RSF.3.1.2 Revenue Forecast

Expected revenue forecasts over the rate setting period are based on historical information, field information, and external economic information including:

- Vehicle premium:
  - Vehicle volume – change in the number of vehicles
  - Vehicle upgrade – change in the average premium generated from customers buying newer higher rated vehicles or moving to different rating classifications
- Driver premium:
  - Driver volume – change in the number of drivers
  - Driver movement – movement of drivers on the Driver Safety Rating scale
- Service fees changes
- Fleet Program rebates and surcharges
- Reinsurance premiums
- Anti-theft discounts

Detailed information on the revenue forecasting process can be found in *Part V(i) Revenues*.

RSF.3.1.3 Expense Forecast

The expense forecast is based on the 2018/19 Forecast Base and adjusted for known contractual agreements, inflationary increases, cost containment strategies, and improvement initiatives or project costs.

Components of the expense forecast include:

- Claims expenses (cost of processing claims)
- Operating expenses
- Road safety expenditures

- Regulatory expenditures
- Commissions and premium taxes
- Improvement initiatives' implementation and ongoing expenditures

Detailed information on the expense forecast can be found in *Part V(i) Expenses*.

RSF.3.1.4 Investment Forecast

The financial model forecasts investment income from the investment portfolio. The investment income forecast incorporates:

- Forecasted interest rates
- Return assumptions for each asset class in the portfolio
- Accounting treatment for each asset class
- Investment portfolio rebalancing rules
- Investment management fees
- Pension expense

Detailed information on the investment income forecast can be found in *Part VI Investments*.

RSF.3.2 Financial Model

The Financial Model:

- Combines the outputs from the claims, revenue, expense, and investment income forecasts
- Allocates the forecasted expenses to each line of business and expense type (claims, operating, road safety and regulatory expenses)
- Creates the Basic pro forma statement of operations and statement of financial position

Updates to the financial modeling tool can be found in *Part VIII Financial Forecasting Model Update*.

The Basic pro forma financial statements can be found in *Part V(i) Pro Formas*.

Detailed information on cost allocation can be found in *Part V(i) Expenses*.

RSF.3.3 Ratemaking

The purpose of ratemaking is twofold:

- Determine the overall expected costs resulting from policies issued for policy year 2019/20; and
- Allocate the overall expected costs equitably to all insureds.

RSF.3.3.1 Break-Even Rates

MPI's mandate is to set rates on a break-even basis. Under AAP, MPI has interpreted this mandate as meaning that rates must not include a provision for profit. The rates presented in the 2019 General Rate Application for the 2019/20 policy year are in accordance with this mandate. Rates are determined such that the total premiums collected will be sufficient to cover the overall expected costs associated with the policies issued for the 2019/20 policy year with no provision for profit. Overall expected costs include the following:

- Claims costs (cost of settling claims)
- Non-claims costs (commissions, operating expenses, etc.)
- Other income sources (driver premiums, and service fees and other revenues), which offset overall expected costs

RSF.3.3.2 Net Capital Maintenance Provision

In this application, MPI has applied for a Net Capital Maintenance Provision (Net CMP), in addition to break-even rates based on AAP. The details of the Net CMP are provided in *Part VI RSR Rate Stabilization Reserve*, but the essential elements are as follows. Rates are determined including a Net CMP to maintain capital adequacy. Specifically, the Net CMP ensures that the MCT ratio, which compares capital available to capital required, at fiscal year-end 2019/20 does not deteriorate (decrease) from fiscal year-end 2018/19. The amount collected through the Net CMP is determined net of investment income earned on the Rate Stabilization Reserve (RSR). By combining the investment income on the RSR and the capital maintenance requirement into a single 'Net CMP', MPI has separated the rate requirement for break-even AAP rates from the rate requirement for capital factors (i.e. investment income on the RSR, CMP).

As in years prior, MPI's base forecast assumes no rate changes beyond the 2019/20 rating period. However, the break-even rate indication and net capital maintenance provision will be recalculated in each rate application.

RSF.3.3.3 Allocate Overall Expected Costs

Overall expected costs are segregated into expected costs by major classification based on the historical indications trended forward to the 2019/20 policy year. The six major classifications are:

- Private passenger vehicles
- Commercial vehicles
- Public service vehicles
- Motorcycles
- Trailers
- Off road vehicles

The expected costs for each major classification are then allocated to vehicle rating groups within the major classification based on claims costs relativities. Vehicles are placed into rating groups based on the following rating variables:

- Territory
- Insurance use
- Rate groups
- Gross vehicle weight (GVW) – Commercial and Public service vehicles
- Body style and engine displacement – Motorcycles

RSF.3.3.4 Required Rates and Experience Adjustments

Required rates refer to the expected costs per vehicle and are calculated at the overall, major classification, and vehicle rating group levels. Experience adjustments are calculated at the vehicle rating group level by comparing the required rate to the current average rate for the respective vehicle rating group.

Detailed information on MPI's vehicle classification system can be found in *Part V(ii) Vehicle Classification System*.

Detailed information on Ratemaking can be found in *Part V(ii) Ratemaking*.

RSF.3.4 Rate Modeling

The Rate Model analyzes the impact on the vehicle population resulting from rate and classification changes.

- Individual classification and relativity changes are applied to the model incrementally. An offset is applied to ensure the changes do not result in an increase or decrease in revenue (revenue neutral). For 2019/20 rates, changes include:
    - Rate group changes for passenger vehicles and light trucks
    - Rate group changes for heavy trucks and heavy rated as light trucks
    - Rate line changes
- Experience adjustments, determined as the end result of the ratemaking steps described in *RSF 3.3* above, are applied to each vehicle in the rate model. The

result is a change in premium revenue equal to the applied for overall required revenue change.

- Relative ranking rules are applied to ensure less restrictive rating categories do not have lower rates than more restrictive ones (e.g. pleasure use rates are not higher than all purpose use rates for the same territory and vehicle type).
- Capping rules are applied. If the combined result of the classification and experience adjustments above result in rates increasing above the percentages established by the PUB, the rates are reduced to the cap amount.
- New rates for each insurance use (e.g. all purpose passenger vehicle, artisan truck, pleasure motorcycle, etc.) are determined.
- Impact on the entire vehicle population is modeled.

Detailed information on Rate Modeling can be found in *Part V(ii) Ratemaking*.

RSF.3.5 Response to Orders 162/16 and 130/17: Total Return, Profit Provision, Capital Maintenance Provision

In prior hearings and technical conferences, MPI and PUB have made significant progress on the following ratemaking topics: (i) ratemaking per AAP, (ii) using a Total Return approach, (iii) the use of investment income on the RSR, and (iv) the need to maintain Basic capital. MPI believes this application reflects the successful outcome of this on-going collaboration on these important topics. MPI's proposed ratemaking approach now reflects the following considerations:

- Break-even rates based on AAP (ordered by PUB in Order 162/16, implemented by MPI in the 2018 GRA);
- Including the investment income earned on the RSR (ordered by the PUB in 130/17, implemented by MPI in the 2019 GRA)
- Adjusted to ensure that the capitalization of Basic is maintained (technical conference ordered by PUB in 130/17; implemented by MPI in the 2019 GRA).

VEHICLES FOR HIRE

VFH.1 MPI APPLIED FOR INTERIM APPROVAL OF VFH RATES

On December 15, 2017, Manitoba Public Insurance ("MPI" or "the Corporation") applied to the Manitoba Public Utilities Board ("PUB" or "Board") for interim approval of premiums charged with respect to compulsory vehicles for hire (VFH) insurance, in accordance with the provisions of *The Crown Corporations Public Review and Accountability Act* and *The Public Utilities Board Act.*

Bill 30, establishing *The Local Vehicles for Hire Act* ("the VFH Act"), received Royal Assent on November 10th, 2017. The VFH Act eliminates regulation of the taxi industry in Winnipeg through the Taxicab Board and transfers regulatory responsibilities for all VFHs to each municipality in the Province of Manitoba. The VFH Act came into force on February 28, 2018 and allowed for a new class of VFH in addition to the existing taxicab/livery service.

To offer compulsory insurance for VFH, MPI sought the Board's approval of premium rates both for this new class of VFH, and for new premium rates for the existing classes of VFH (taxicabs, limos and wheelchair accessible vehicles).

The Corporation requested interim approval of the following rates for service effective March 1st, 2018:

- The premiums charged with respect to compulsory VFH Rates for Service, effective March 1, 2018.
    - Interim VFH Rates for Service are being requested for both the 2017/18 and 2018/19 insurance year in this application, as reflected in Appendix 1 and Appendix 2 of the Interim Application, based on rates approved in PUB Orders 162/16 and 130/17 respectively.
- Changes to eligibility for vehicle premium discounts for VFHs, also as reflected in Appendix 1 and Appendix 2 of the Interim Application.

- Waiving of service fees for change of insurance for VFHs
- A mechanism for refunding/collecting any variance between interim and final approved VFH Rates for Service, as determined through the 2019 General Rate Application (GRA)

Further, MPI proposed:

- Other than as specified above, no change to service fees for changing coverage
- No change to Miscellaneous permits and certificates
- No change to driver license premiums
- No change to fleet rebates and surcharges

Rate tables for Interim VFH Rates for Service were included as Appendix 1 and Appendix 2 in the Vehicles for Hire 2018 Interim Application. The Interim Application can be found in Appendix 1.

VFH.2 PUB BOARD ORDER 11-18 APPROVES INTERIM APPLICATION

The PUB approved the Interim Application for interim 2017/18 and 2018/19 VFH premium rates. The Board found that Transportation Network Companies (TNCs) are a new business model in North America, and accordingly, there is a lack of experience upon which insurance rating models and rates can be developed. The Board took this into account in approving the rates applied for by the Corporation. However, the Board issued a number of directives to MPI (responses in bold font) including the following:

6.1 The Rates for Service for vehicles for hire for the 2017/18 and 2018/19 insurance years, as set out in Appendix 1 and Appendix 2 to the Vehicles for Hire 2018 Interim Application filed by Manitoba Public Insurance on December 15, 2017, BE AND HEREBY ARE APPROVED on an interim basis, effective March 1, 2018.

6.2 The Corporation shall apply for final Rates for Service for vehicles for hire for the 2017/18 and 2018/19 insurance years in the 2019 General Rate Application.

See VFH.3 – MPI APPLIES FOR FINAL VFH RATES FOR SERVICE

6.3 The Corporation shall refund or collect any variance between interim Rates for Service hereby approved and the Rates for Service finally approved through the 2019 General Rate Application (GRA).

See VFH.3 – MPI APPLIES FOR FINAL VFH RATES FOR SERVICE

6.4 Vehicles for hire in all categories of the vehicles for hire pool shall be eligible for Driver Safety Rating vehicle premium discounts if registered by individual customer.

6.5 The waiving of service fees for changes of insurance coverage for vehicles for hire BE AND HEREBY IS APPROVED.

6.6 The Corporation shall inform vehicles for hire customers, in advance of placement of coverage, of the possibility of a refund or the collection of additional premiums due to a re-rating resulting from the final approval of Rates for Service for vehicles for hire through the 2019 GRA.

See VFH.8 – MPI'S COMMUNICATION WITH CUSTOMERS HAS BEEN THOROUGH AND EFFECTIVE

6.7 The Corporation shall develop and report on a plan for the collection of data specific to the vehicles for hire pool and shall file the report in the 2019 GRA. The plan the Corporation is to develop will include collection of information as to:

6.7.1 A new vehicles for hire insurance use pool so that experience suitable for ratemaking can be tracked separately from other Basic vehicle classes;

See VFH.6 – MPI ESTABLISHES VFH RATE MAKING FRAMEWORK

6.7.2 Tracking of ratemaking experience (e.g., exposures, premiums, and claim counts and amounts) within the vehicles for hire pool, separated by each sub-category within the vehicles for hire pool (e.g., use category, number of time bands, territory), as well as separated by each time band;

See VFH.6 – MPI ESTABLISHES VFH RATE MAKING FRAMEWORK

6.7.3 Forecasting of claims incurred for the vehicles for hire pool; and a means of allocating to the appropriate time band those claims occurring during any overlap of time bands in which the customer has selected both of the overlapping time bands.

See VFH.6 – MPI ESTABLISHES VFH RATE MAKING FRAMEWORK

6.7.4 The Corporation shall gather data on the number and frequency of changes made to insurance policies for vehicles for hire and provide a report in that regard in the 2019 GRA.

See VFH.7 – DATA COLLECTION – RATE MAKING

6.8 In the 2019 GRA, the Corporation shall provide information as to the total cost resulting from the vehicles for hire rating model. The total cost information shall include, but will be not be limited to:

6.8.1 The financial impact of changes on the Corporation's pro forma financial forecast;

6.8.2 Driver safety rating premium discounts;

6.8.3 Reduced deductible from $600.00 to $500.00 for taxicabs, limousines and accessible vehicles for hire;

6.8.4 One-time and ongoing information technology costs related to upgrading or modifying the AOL and CARS programs to accommodate vehicles for hire; and

6.8.5 Broker commission and service fees relating to transactions associated with vehicle for hire registration and time band selection.

See Part V (i) Expense Appendix 20

6.9 In the 2019 GRA, the issue of Passenger VFH insurance rates as compared to the Taxicab VFH insurance rates be reviewed.

See VFH.6 – MPI ESTABLISHES VFH RATE MAKING FRAMEWORK

6.10 In the 2019 GRA, the Corporation shall examine the issue of whether, for insurance purposes, the Taxicab vehicles for hire category should be

eliminated such that Taxicabs would fall within another vehicles for hire use category.

See VFH.6 – MPI ESTABLISHES VFH RATE MAKING FRAMEWORK

6.11 The Corporation shall monitor best practices and standards of the TNC industry and present the results of its monitoring in the 2019 GRA.

See VFH.9 – MPI EVALUATES BEST PRACTICES IN TNC INDUSTRY

6.12 In the 2019 GRA, the Corporation shall file a report on engagement that it has conducted relating to vehicles for hire with any stakeholders such as the City of Winnipeg, other municipalities, TNCs, consumer groups, representatives of the taxicab industry and disability groups.

See VFH.10 – MPI CONTINUES WITH STAKEHOLDER ENGAGEMENT

6.13 Included among the issues to be examined in the 2019 Road Safety Technical Conference directed in Order 130/7 shall be:

6.13.1 Safety for drivers and clients of VFH:

6.13.2 Safety and training standards for all VFH drivers; and

6.13.3 Safety issues relating to persons with disabilities and VFH

6.14 The road safety information filed by the Corporation in the 2019 GRA include information regarding emerging road safety issues as a result of the introduction of TNCs in Manitoba

See Part VII – Working towards Safer Roads through Effective Public Insurance of 2019 GRA

VFH.3 MPI APPLIES FOR FINAL VFH RATES FOR SERVICE

As part of the 2019 GRA, MPI is applying for final approval of 2017/18 and 2018/19 VFH Rates for Service, as well as 2019/20 VFH Rates for Service. For the 2019/20 rates for VFH vehicles, the Corporation utilized the same methodology as was used for setting the 2018/19 rates as presented in *Part V(ii) Vehicles for Hire Appendix 1 Interim VFH Application*.

Should the Board's final determination on 2017/18 and 2018/19 VFH rates in the 2019 GRA Order have any variance to the interim approved VFH rates, any difference in rates will be rebated or collected on a customer by customer basis by the process explained in the following section.

VFH.3.1 MPI's Automated Re-Rating Process

MPI currently has an automated process to trigger a "re-rating" of an insurance policy without requiring a customer visit to a broker or service centre. If the PUB approves final VFH Rates for Service for the 2017/18 and 2018/19 insurance years that differ from the approved interim rates, MPI will identify all VFH customers and initiate a re-rating of the insurance policy. This will complete a new insurance rating calculation process and the new approved rates will be used to determine the appropriate insurance premium that should have been collected. In the event of either an increase or reduction in premium, the associated balance will be applied to the respective customer account and a letter will be sent to each customer with an explanation. This avoids the risk of customers paying higher than required rates and MPI charging inadequate rates.

VFH.4 MPI's VFH RATING MODEL BEST MEETS SUCCESS CRITERIA

MPI initially examined nine insurance solution models/options. They were evaluated at a conceptual level using nine criteria and from these nine options, the top three models were selected for further evaluation and rated based on the following three success criteria:

1. That the rating model is fair and equitable
2. That the rating model is actuarially-based
3. That the rating model is flexible enough to accommodate different regulatory frameworks throughout the province as a result of Bill 30

MPI selected the Time Restriction (Time Band) model because it complies with the existing regulatory process and it best satisfied the three success criteria overall.

Under the Time Band model, the VFHs pool consists of four 4 categories:

1. Taxicab VFH
2. Limousine VFH
3. Accessible VFH
4. Passenger VFH

The insurance policies are based on time bands permitting VFH operation. Each of the 4 categories have the same 4 time bands available to them. Customers can self-select any combination of 4 time bands and premiums are based on the number of time bands selected. Customers have the option to purchase 1, 2, 3, or all 4 time bands. At 4 time bands, a vehicle for hire has the flexibility to operate 24 hours a day, seven days a week.

Figure VFH - 1: Time Bands for Insured VFH Commercial Operation

Line No.	Time Bands	Time of Insured Commercial Operation
1	**A**	Monday through Friday 10:00 am to 3:00 pm and Sunday through Thursday from 7:00 pm to 11:00 pm
2	**B**	Nightly 11:00 pm to 7:00 am
3	**C**	Monday through Friday 7:00 am to 10:00 am and 3:00 pm to 7:00 pm
4	**D**	Friday 6:00 pm through Sunday 11:00 pm

Outside of the time bands, VFHs are insured for non-commercial operation. If a vehicle for hire fare originates during the selected time band, but extends beyond the time band and completes during a non-commercial operation time period, insurance coverage for VFHs operation will extend to cover the duration of that fare.

The insured times of each time band were designed to accommodate the hours of operation that VFHs drivers might prefer, such as weekends, or evenings, while balancing the increased level of exposure from operation between the four time bands. As the selection of time bands is flexible, customers can tailor their operating periods and related insurance costs to fit their availability and desired part-time or full-time VFH participation level. The designed overlap in time between the Overnight and Weekends time bands also provides further flexibility for customers who may not want to select more than one time band. The time bands are intended to provide TNC operators more options but for those operators who want complete flexibility they can purchase all four time bands.

As data accumulates for the various VFH insurance uses, MPI will monitor the trends. If any of the time bands deviate too far from the ~25% of overall claims incurred, MPI will determine the action necessary (i.e. possibly adjusting the time bands).

VFH.5 MPI ESTABLISHED VFH COVERAGE CONSISTENT WITH BASIC

In keeping with the intent of the VFH Act, all VFH will have the following Basic insurance coverage consistent with Basic's all-purpose passenger vehicle coverage:

- $200,000 Third Party Liability
- $50,000 Maximum Insured Value
- $500 deductible

As a result of this change, taxicabs, limousines and livery vehicles (former 'x-plate' vehicles) will see Basic deductible reduced by $100. MPI is not proposing to increase VFHs Basic insurance rates due to the decrease in deductible level from $600 (deductible level for previously 'x-plate' vehicles) to $500 (VFHs deductible level). The policy decision to lower the deductible level is meant to align VFHs with the rest of Basic, and is justified based on an expectation of reduced risk exposure in these classes.

Comprehensive no-fault bodily injury coverage will continue to apply to Manitobans injured in motor vehicle accidents including VFH accidents.

VFH.6 MPI ESTABLISHES VFH RATE SETTING FRAMEWORK

The Corporation set different rates for the four categories of VFHs (Passenger VFH, Taxi VFH, Limousine VFH, and Accessible VFH). Since many customers would still have had rates from the 2017/18 policy year in effect at the time that the VFH insurance uses came into effect, the Corporation prepared 2017/18 equivalent rates for each of the new insurance uses. The methodology utilized for those rates was identical to the methodology used to calculate the 2018/19 rates but using 2017/18 Board-approved rates.

The interim rates for Taxicab, Limousine, and Accessible VFH classes were based on the existing rates for these classes with an adjustment to account for the introduction of time bands, Driver Safety Rating (DSR), and competition from Passenger VFH. MPI believes the rates for these classes, on an overall basis, are reasonably close to the eventual experienced based rates under the new VFH model.

For Passenger VFH, MPI recognized that there were no historical claims experience for this rating classification. Given the lack of MPI data on Passenger vehicles for hire loss experience, the proposed initial rates for Passenger vehicle for hire were set based on the percentage difference between All Purpose and Passenger vehicles for hire rates used in other jurisdictions (8% to 24%). Therefore, the interim rates were calculated based on modifications to the existing PUB approved, Major Class 1, All-Purpose Insurance Use rates by rate group. MPI judgmentally applied a “load” to these actuarially-based rates to account for the assumed increase in exposure from varying levels of VFH exposure. The percentage premium increase is based on the number of time bands selected with each time band selected resulting in a premium increase of 5% (i.e. selecting all 4 time bands results in a premium increase of 20%). The ‘percentage increase’ method was assumed to best reflect the difference in coverage and loss experience in Manitoba.

Going forward, as experience data becomes available (i.e. in the 2020 GRA), the proposed rates for all VFH categories will be adjusted based on actual claims experience utilizing the existing PUB approved rate making methodology. MPI will then perform a separate relativity calculation within each of these VFH uses to determine

the relative rates by Level (1, 2, 3, 4). By setting rates based on the overall VFH experience in each VFH use (rather than for each level separately) there will be more credible data from which to modify rates.

Please see page 13 of *Part V(ii) Vehicles for Hire Appendix 1 - Interim VFH Application* for a detailed explanation of the VFH Rate Setting Framework.

VFH.6.1 Taxi VFH vs. Passenger VFH

The Corporation acknowledges that there is a significant difference in rates between the Passenger VFH category and the Taxi VFH category. However, MPI believes that offering DSR incentives, when combined with the industry's public comments about focusing on safety, and the loss prevention strategies MPI is working collaboratively with the taxi industry on will have a positive effect on loss experience.

The VFH framework is such that loss experience for each of the VFH categories will be tracked separately. As experience data becomes available, the Corporation will continue to ensure that the rates assigned to each VFH group is reflective of the risk and actuarially supported. The Corporation will also be in a better position to determine if Taxicabs should fall within another VFH category. However, at this time there is no basis for the Corporation to make a change to the current rating model.

VFH.7 DATA COLLECTION – RATE MAKING

The primary means of limiting cross subsidization between VFH, and the rest of Basic, is through the creation of a new pool to track the VFH claims experience. MPI is collecting the same information on VFH policy claims as it does for all other policies. The claims experience for VFH classes will be tracked separately, through the use of an additional field in MPI's system. These separately tracked claims will form the 'VFH pool' that will be used to set actuarially sound rates for VFH policies. Once a customer is a VFH policy holder, all claims under that policy will fall into the VFH pool. For example, a collision occurring outside the VFH time bands will still be tracked within the VFH pool. Also, since rates are determined based on the number of time bands purchased, not the specific time bands, there is no consequence of having overlapping time bands for actuarially sound rates.

Apart from establishing a separate pool, as outlined above, MPI will continue to employ its processes to ensure that claimants are correctly insured at the time of a claim, for example, ensuring that VFH drivers are correctly insured under a VFH policy, and under the appropriate sub category (passenger, taxi, limo, accessible).

These processes are similar to those already in place for detecting and ensuring coverage for the date/time of loss, and adherence to all conditions (such as vehicle use for purposes not intended under the policy).

As of April 30, 2018 the number of insured VFH vehicles (all territories) are as follows:

Figure VFH - 2: Insured VFH vehicles (all territories)

	Number of Time Bands				
VFH Category	1	2	3	4	**Total**
Accessible	1	1	5	28	**35**
Limo	3	0	0	33	**36**
Passenger	12	12	4	276	**304**
Taxi	5	3	4	485	**497**
Total	**21**	**16**	**13**	**822**	**872**

As of May 22, 2018 there have been a total of 191 VFH related claims. The breakdown is as follows:

Figure VFH - 3: VFH related claims

	Number of Time Bands				
VFH Category	1	2	3	4	**Total**
Accessible	0	0	0	5	**5**
Limo	0	0	0	3	**3**
Passenger	0	0	4	43	**47**
Taxi	0	0	0	136	**136**
Total	**0**	**0**	**4**	**187**	**191**

The number of customers who changed their VFH insurance (as of April 30, 2018) (i.e. changed the number of time bands or VFH category) is as follows:

- Increased the number of time bands (same VFH category) – 20
- Decreased the number of time bands (same VFH category) – 9
- Changed the VFH category – 5

VFH.8 MPI'S COMMUNICATION TO CUSTOMERS HAS BEEN THOROUGH AND EFFECTIVE

VFH.8.1 Communication with VFH Customers

Also, with the issuance of new VFH insurance uses, MPI created a custom training program for MPI agents such as insurance brokers and frontline staff involved in the sale of VFH insurance policies. Training was mandatory and, in compliance with the PUB order 6.6, all MPI agents are required to advise customers in advance of purchasing VFH insurance policies the possibility exists that a refund or the collection of additional premiums due to a re-rating resulting from the final approval of Rates for Service for VFHs through the 2019 GRA. MPI agents are required to leave a comment on the Policy Application, which is signed by the customer, indicating that they have informed the customer.

VFH.8.2 Communication with "Outliers"

The dissolution of the Taxicab Board and the VFH Act definition of 'vehicle for hire' resulted in certain outliers. Previously 'x-plated' taxi/livery vehicles with seating capacity of 11 or more were not captured under the VFH Act, and did not qualify for VFH insurance policies. However these vehicles must still change registration class and insurance use due to the discontinuance of the 'x-plated' registration class. Based on the customer's declared use of the vehicle, existing registration classes such as Regulated Passenger Vehicle (AR) and Public Service Vehicle (PSV) and existing insurance uses such as Common Carrier, Charter Bus – Local, Disabled Persons Bus, and Private/Business Bus will be used for vehicles that fall outside of the VFH Act definition of 'vehicle for hire' . There were fewer than 100 policies affected and though there may be changes in premiums charged, in the vast majority of cases it is expected that there will not be a negative financial impact to these customers. MPI worked in coordination with the Province of Manitoba to communicate the changes to existing taxi/livery policy holders. MPI mailed letters to all existing taxi and livery customers (x-plated vehicles) informing them of the changes. Information provided to

customers that met the VFH definition detailed the availability of new VFH insurance post March 1st 2018, changes to deductibles and the eligibility for DSR discounts for individuals. For taxis and livery vehicles that did not meet the VFH definition, MPI advised customers by letter of their registration and insurance options.

VFH.9 MPI EVALUATES BEST PRACTICES IN TNC INDUSTRY

Rating models used in other Canadian jurisdictions were not considered suitable with Manitoba's public insurance environment given the compulsory nature of Basic and as of the time of this application's preparation, British Columbia and Saskatchewan have not permitted the operation of TNCs. As such, the ongoing review of existing VFH frameworks does not include any public insurers comparable to MPI. Figures 4 and 5 present the results of the updated scan as per Order 6.11.

Figure VFH - 4: TNC – Jurisdictional Insurance Comparison / Availability (Ontario)

The coverage and deductible payable by the driver are those included in his/her personal auto policy.

Currently in Canada, only Alberta, Ontario and Quebec allow ridesharing (vehicle for hire) for compensation. Insurance for ridesharing vehicles in these jurisdictions is provided by either individual endorsement or a blanket policy with the particular TNC. In all three jurisdictions, automobile insurance is sold privately and subject to limited accident benefits[1] (injury), third party liability coverage and tort action. First party physical damage coverage is optional in all three jurisdictions.

The legislative scheme in Manitoba requires residents who wish to operate a motor vehicle in Manitoba to register that vehicle and purchase universal compulsory automobile insurance (Basic Insurance) which is primary to any other insurance that may apply. This includes mandatory first party coverage. Basic Insurance also provides Personal Injury Protection Plan benefits as well as third party liability and all perils physical damage coverage.

Alternative insurance models used in other jurisdictions would, if adopted in Manitoba, result in coverage outside of Basic Insurance. A consequence of which would be that the premiums charged for VFH insurance would be outside the jurisdiction of the Public Utilities Board. The Corporation submits that it would not be in the public interest to intentionally design compulsory insurance coverage for passenger vehicle operations that is outside of Basic and therefore outside of regulatory oversight.

The universal compulsory nature of the program does not contemplate, nor does the legislation permit, that Basic compulsory insurance coverage become secondary, based on temporary (or part time) change in vehicle use from a passenger vehicle to a VHF. Across the Basic compulsory program, the rates charged for the vehicle are based upon the type of vehicle, its use, and its location (territory). Basic coverage remains constant in all cases, and the only change is in the rate charged, reflecting the use, type and territory of the vehicle. VFH is a new use and it is appropriate that Basic rates be set for that type/use.

Use of an umbrella policy with a TNC or individual endorsement is not appropriate for providing compulsory coverage under the Basic program. Providing Basic insurance to

[1] With exception of Quebec, which has pure no-fault injury coverage

TNCs through an umbrella policy also creates the risk that individual operators would not incur their true incremental cost of insurance; as they will under MPI's proposed model that accounts for vehicle type and driver safety. In addition, the use of an umbrella policy would not be fair and equitable to existing VFHs, such as taxis and limos.

In summary, a VFH is required to have Basic Insurance. The requirement to hold the coverage and the obligation of the Basic coverage to respond as primary in the event of a loss does not change based upon the use, type, or territory of the vehicle.

VFH.10 MPI CONTINUES STAKEHOLDER ENGAGEMENT

MPI conducted initial discussions with a number of stakeholders including:

- The Winnipeg Community Taxi Coalition
- Uber
- Lyft
- City of Winnipeg
- Manitoba Infrastructure
- Manitoba Crown Services
- Indigenous and Municipal Relations
- Motor Transport Board
- Taxicab Board

At these discussions, MPI reviewed a number of topics including:

- The overall VFH rating model
- Relevant legislation related to the basic, compulsory insurance program in Manitoba, including first-party coverage extended to all Manitoba residents and occupants of Manitoba-registered vehicles injured in motor vehicle collisions.
- The rate-making and regulatory framework in Manitoba, including the role of the PUB in approving basic insurance rates
- Creation of a separate insurance use for VFH and sub-categories within that classification to ensure rates charged are actuarially sound and to prevent no cross-subsidization within the pool or by other vehicle classes
- The time bands framework
- Changes to the vehicle registration model and plating requirements for VFH
- Adjustments to DSR eligibility and vehicle premium discounts
- Service fees

Although discussions between MPI and stakeholders have been substantial to date, they remain ongoing, particularly with those in the taxi and TNC industries.

As reported in the media, feedback from operating TNCs has been positive. Please see *Part V(ii) Vehicles for Hire Appendix 2*.

VEHICLES FOR HIRE APPLICATION

VFH.1 LEGAL APPLICATION

Manitoba Public Insurance ("MPI" or "the Corporation") applies to the Manitoba Public Utilities Board ("PUB" or "Board") for interim approval of premiums charged with respect to compulsory vehicles for hire insurance, in accordance with the provisions of *The Crown Corporations Public Review and Accountability Act* and *The Public Utilities Board Act*.

Bill 30, establishing *The Local Vehicles for Hire Act* ("the VFH Act"), received Royal Assent on November 10th, 2017. The VFH Act eliminates regulation of the taxi industry in Winnipeg through the Taxicab Board and transfers regulatory responsibilities for all vehicles for hire to each municipality in the Province of Manitoba. The VFH Act comes into force on February 28, 2018 and allows for a new class of vehicles for hire in addition to the existing taxicab/livery service.

To offer compulsory insurance for vehicles for hire, MPI must seek and obtain the Board's approval of premium rates both for this new class of vehicles for hire, and for new premium rates for the existing classes of vehicles for hire (taxicabs, limos and wheelchair accessible vehicles).

The Corporation is requesting interim approval of the following rates for service effective March 1st, 2018:

- The premiums charged with respect to compulsory vehicles for hire Rates for Service, effective March 1, 2018.
    - Interim vehicles for hire Rates for Service are being requested for both the 2017/18 and 2018/19 insurance year in this application, as reflected in Appendix 1 and Appendix 2 to this Application, based on rates approved in PUB Orders 162/16 and 130/17 respectively.

- Changes to eligibility for vehicle premium discounts for vehicles for hire, also as reflected in Appendix 1 and Appendix 2.
- Waiving of service fees for change of insurance for vehicles for hire
- A mechanism for refunding/collecting any variance between interim and final approved vehicles for hire Rates for Service, as determined through the 2019 General Rate Application (GRA)

Further, MPI proposes:

- Other than as specified above, no change to service fees for changing coverage
- No change to Miscellaneous permits and certificates
- No change to driver license premiums
- No change to fleet rebates and surcharges

Rate tables for Interim vehicles for hire rates for service are included as Appendix 1 and Appendix 2 to this Application.

VFH.2 INTRODUCTION AND OVERVIEW

The VFH Act introduced significant changes to the transportation service industry in Manitoba, and with this interim application, MPI proposes a consistent and responsive insurance framework for all vehicles for hire anticipating that a range of regulatory frameworks may be adopted at the municipal level.

The proposed insurance framework will offer increased flexibility of insurance coverage to existing taxi/livery service vehicles, as well as new vehicles for hire customers. Time bands for coverage of vehicles for hire operation will allow operators to select desired times of coverage, tailoring their insurance costs to meet their operating needs.

Where possible, pricing of policies has been based on known experience, and the price of future policies will incorporate claims experience to ensure that customers are paying appropriate premiums. Vehicles for hire insurance policies will also be tracked in a separate pool, ensuring there is no impact on the rest of Basic's customers.

MPI seeks interim approval of vehicles for hire premiums, effective March 1, 2018, to coincide with the VFH Act coming into force. This interim application is meant to reflect the will of the Manitoba Legislature to enable the new form of commerce contemplated under the Act, and to prevent the obvious harm that will result if there is no appropriate insurance product available when the VFH Act comes into force.

MPI will seek final approval of vehicles for hire Rates for Service through its usual GRA process, expected to be filed in June of 2018. Through the GRA process, MPI anticipates that parties granted standing will be afforded the opportunity to fully test the justness and reasonableness of the proposed Rates for Service. MPI will refund or collect any variance between the Board's interim and final determination of Rates for Service a customer by customer basis.

MPI anticipates that this interim application and the 2019 GRA will focus substantively on testing the pricing of the policies, consistent with the intent of section 25 of the *Crown Corporations Governance and Accountability Act*. However, to provide the Board and interveners a thorough understanding of MPI's proposed pricing, this application also includes details of the overall vehicles for hire framework, such as impacts to vehicle registration, customer and implementation timelines.

VFH.2.1 Legislative Context for the Application

The VFH Act received royal assent on November 10, 2017, and will come into force on February 28, 2018.

The VFH Act removes the references to 'taxicab' from *The Highway Traffic Act* and *The Drivers and Vehicles Act*, and creates a new definition for a 'vehicle for hire'. The VFH Act also dissolves the Taxicab Board (which currently regulates taxicabs operating within the City of Winnipeg), transfers responsibility for the regulation of vehicles for hire to municipalities, and specifically requires the City of Winnipeg to establish a by-law to regulate the vehicles for hire industry.

Under the VFH Act, the new definition of 'vehicle for hire' – any vehicle designed for 10 or fewer occupants (including the driver) that is hired by a passenger for a single trip, where the passenger controls the route or destination – will include existing taxicabs, limousines and executive cars, as well as vehicles hired via online ridesharing platforms.

As per reports, the City of Winnipeg intends to have a by-law in force on March 1, 2018 to regulate all vehicles for hire in Winnipeg, and authorize ridesharing operations in the city.[1] Other municipalities may also make changes to their by-laws to allow ridesharing or otherwise regulate vehicles for hire.

VFH.2.2 Principles for the Rating Model

Transportation Network Companies (TNCs) are a relatively new business model in North America, and in Canada in particular. Based on MPI's analysis of TNC by-laws and insurance rates in Canada, no industry standard has developed on insurance rating models within or across jurisdictions that currently permit operation of TNCs. Further, coverage and pricing varies by insurance company within and across jurisdictions.

As at the time of this application's preparation, British Columbia and Saskatchewan had not permitted the operation of TNCs. As such, the review of existing vehicles for hire frameworks did not include any public insurers comparable to MPI.

MPI developed and evaluated several rating models within the context of the compulsory nature of Basic, and MPI's intent to limit cross-subsidization between vehicles for hire and the rest of Basic. MPI selected the rating model that best satisfied the following success criteria overall:

[1] Nick Martin, "Uber ready, waiting for Winnipeg," *Winnipeg Free Press*, posted online October 23, 2017

1. **Is the rating model fair and equitable?**
   The proposed rate model is fair and equitable in that it applies consistently to taxis, TNCs, and other vehicles for hire. All vehicles for hire operators will have the flexibility to select up to four time bands depending on when and how frequently they intend to offer vehicle for hire services. The declared time bands uses will be priced for risks based on current claims data. All vehicles for hire operators will also have the same Basic.

2. **Is the rating model actuarially-based?**
   MPI established vehicles for hire Rates for Service in accordance with existing Basic rates to accommodate vehicles for hire insurance use in a way that is consistent and equitable based on prior rates experience. Experience-based rate adjustments will be used to maintain rates that are equitable as experience is gained with vehicles for hire insurance use. A new vehicles for hire insurance use will be created so that claims experience can be tracked separately from the private passenger vehicle pool.

3. **Is the rating model flexible enough to accommodate different regulatory frameworks throughout the province as a result of Bill 30?**
   MPI established a broad range of vehicles for hire insurance uses anticipated to accommodate different municipal regulatory frameworks.

VFH.2.3 Vehicles Eligible for Vehicles for Hire Insurance

To register and insure vehicles for hire operated in Manitoba, MPI has deemed two vehicle types as eligible for the new insurance uses:

1. Passenger Vehicles (passenger cars, limousines, SUVs, mini-vans, etc.), and

2. Light Trucks[2] (eligible for A5 registration with a Gross Vehicle Weight that is less than 4,500 kg)

The passenger vehicle type will capture existing taxicabs, limousines (seating of 10 or fewer), and accessible taxicabs, as well as the vehicles hired via online ridesharing platforms.

Light trucks eligible to be registered in the A5 registration class are included in order to keep the option of ridesharing open to a broad section of Manitoba's population, including rural or northern regions which may currently be underserved by vehicles for hire, and where ownership of a personal truck may be more common than a passenger vehicle.

Heavy trucks with a Gross Vehicle Weight of 4,500 kg and over are not eligible for vehicles for hire insurance coverage. Trucks over 4,500 kgs are generally vehicles registered and insured for business or commercial purposes, and are subject to a range of regulatory requirements for heavy trucks, such as the provincial Periodic Mandatory Vehicle Inspection and the Safety Fitness Certificate. Due to differences in use and loss profile, these heavy trucks were not considered appropriate for inclusion in the vehicle for hire rating pool with personally-owned passenger vehicles and light trucks.

Similarly, motorcycles are not eligible for vehicle for hire insurance as their risk exposure and loss experience is substantively different from other vehicles in the vehicle for hire pool. Further, the vehicles for hire marketplace in North America has not adopted motorcycles or mopeds as eligible vehicles associated with the service. As the vehicles for hire service continues to mature, MPI will monitor the experience of other North American jurisdictions. If motorcycles and mopeds become more prevalent in this marketplace, MPI will re-evaluate the local market needs and options.

[2] Light trucks will be eligible for passenger vehicles for hire insurance use only.

Vehicles with seating for 11 or more (including the driver) are not included in the VFH Act definition of a 'vehicle for hire' and so will not be eligible for vehicle for hire insurance.

VFH.2.3.1 Discontinued 'X Plate' Registration Class

To provide context for the Board's understanding of the rate application, changes to the vehicle registration classes are explained below.

In keeping with the intent of the VFH Act, vehicles for hire passenger vehicles and light trucks will be registered in the respective passenger vehicle or light truck registration class with regular plates. No new registration class, stickers, or plates will be created for vehicles for hire.

To streamline the registration process and system, MPI will discontinue the registration classes used for existing taxis, limousines and liveries. At present, the 'X-plate' registration class is comprised of four classes which are issued licence plates beginning with "X":

- X1 – Taxicabs
- X2 – City Liveries
- X3 – Limousines Liveries
- X4 – Country Liveries

The 'X-plate' registration classes will be expired and those registration classes will no longer be issued after April 30, 2018. The use of 'x-plates' will be discontinued and, all VFH vehicles will be issued standard plates.

Vehicles for hire will be registered in either the A1- Passenger Vehicles or A5- Trucks registration class, and will be eligible for Specialty Plates and Personalized Licence Plates.

Further details are discussed in section VFH.4.1 - Implementation plan.

VFH.2.4 Vehicle for Hire Rating Model

The Vehicles for Hire pool will consist of four 4 sub-categories:

1. Taxicab VFH
2. Limousine VFH
3. Accessible VFH
4. Passenger VFH

Premiums for each category have been established separately, which is discussed further section VFH.3.

The insurance policies will be based on time bands permitting vehicles for hire operation. Each of the 4 sub-categories (passenger, taxi, etc.) will have the same 4 time bands available to them. Customers can self-select any combination of 4 time bands and premiums will be based on the number of time bands selected. Customers will have the option to purchase 1, 2, 3, or all 4 time bands. At 4 time bands, a vehicle for hire has the flexibility to operate 24 hours a day, seven days a week.

Figure 1: Time Bands for Insured VFH Commercial Operation

Line No.	Time Bands	Time of Insured Commercial Operation
1	**A**	Monday through Friday 10:00 am to 3:00 pm and Sunday through Thursday from 7:00 pm to 11:00 pm
2	**B**	Nightly 11:00 pm to 7:00 am
3	**C**	Monday through Friday 7:00 am to 10:00 am and 3:00 pm to 7:00 pm
4	**D**	Friday 6:00 pm through Sunday 11:00 pm

Outside of the time bands, vehicles for hire will be insured for non-commercial operation. If a vehicle for hire fare originates during the selected time band, but

extends beyond the time band and completes during a non-commercial operation time period, insurance coverage for vehicles for hire operation will extend to cover the duration of that fare.

The insured times of each time band were designed to accommodate the hours of operation that vehicles for hire drivers might prefer, such as weekends, or evenings, while balancing the increased level of exposure from operation between the four time bands. As the selection of time bands is flexible, customers can tailor their operating periods and related insurance costs to fit their availability and desired part-time or full-time vehicles for hire participation level. The designed overlap in time between the Overnight and Weekends time bands also provides further flexibility for customers who may not want to select more than one time band.

VFH.2.4.1 Service Fees

To facilitate the transition to this new vehicle for hire insurance framework, there will be no charge when changing the insurance on a passenger vehicle or light truck to vehicle for hire. MPI may reevaluate this approach in future GRAs.

In most cases, when changing a vehicle registration class, a $15 vehicle registration class change fee applies. However, the ‘X-plate’ class policies moving to A1/VFH will be cancelled pro rata and then reactivated, therefore no vehicle registration class fee will apply.

There will be no charge associated with changing the vehicle for hire operating time bands meaning customers can add or drop time bands as needed. For example:

- Increasing or decreasing the number of time bands
- Changing the selected time band

A $15 vehicles registration class change applies in most cases, however, insurance use changes will not be charged a fee. ‘X-plate’ class policies moving to A1/VFH will be

cancelled pro rata and then reactivated, therefore no fee for registration class change will apply.

MPI collects service and transaction fees to offset the costs associated with Basic Insurance. The proposed fee is consistent with the Basic Autopac Service and Transaction fees currently approved by the PUB. All service fees are currently being reviewed in compliance with Directive 11.6 to PUB Order 130/17.

VFH.2.5 Vehicle for Hire Basic Coverage

In keeping with the intent of the VFH Act, all vehicles for hire will have the following Basic insurance coverage consistent with Basic's all-purpose passenger vehicle coverage:

- $200,000 Third Party Liability
- $50,000 Minimum Insured Value
- $500 deductible

As a result of this change, taxicabs, limousines and livery vehicles (former 'x-plate' vehicles) will see Basic deductible reduced by $100. MPI is not proposing to increase vehicles for hire Basic insurance rates due to the decrease in deductible level from $600 (current deductible level for 'x-plate' vehicles) to $500 (vehicles for hire deductible level). The policy decision to lower the deductible level is meant to align vehicles for hire with the rest of Basic, and is justified based on an expectation of reduced risk exposure in these classes (see section VFH.3 for further details).

Comprehensive no-fault bodily injury coverage will continue to apply to Manitobans injured in motor vehicle accidents including vehicles for hire accidents.

VFH.3 RATE SETTING FRAMEWORK

The following sections describe the rate setting framework for each of the sub-categories of vehicles for hire rates. The rate tables for 2018/19 premiums are provided in Appendix 1 to this Application, while rate tables for 2017/18 premiums are provided in Appendix 2.

Definitions provided in the following sections are the working definitions to enable customers to select the correct insurance product, but the specific wording of these definitions may be amended when incorporated into the *Automobile Insurance Certificates and Rates Regulation*, M.R. 23/2017.

VFH.3.1 Passenger VFH

Definition: Passenger vehicles for hire has two sub categories, one for passenger vehicles and one for trucks. Each are defined as follows:

- **"passenger vehicle-for-hire (passenger vehicle)"** means a vehicle for hire, which is a passenger vehicle and is not a taxicab vehicle for hire, a limousine vehicle for hire, an accessible vehicle for hire, or a vehicle owned or operated by or on behalf of a municipality to provide public transportation services;
- **"passenger vehicle-for-hire (truck with 4,499 kg GVW or less)"** means a vehicle for hire that is a truck with a gross vehicle weight of 4,499 kg or less and a body style as described in Schedule AA of the *Automobile Insurance Certificates and Rates Regulation*, M.R. 23/2017 under *The Manitoba Public Insurance Act*

What is changing from a ratemaking perspective? Passenger vehicles and light trucks are eligible to operate as vehicles for hire.

Current Rates: This rating class does not currently exist.

Ratemaking Assumptions: It is assumed that the characteristics of this group are as follows:

- The operation of the vehicle does not fall within the definition of Taxi vehicles for hire, Limo vehicles for hire, or Accessible vehicles for hire, which are described in the following sections.
- Loss exposure is greater than the Private Passenger All Purpose insurance use, but less than a taxi[3].

Internal data to support ratemaking: None. Passenger vehicles for hire has never existed in the province. The current Taxi/Livery Passenger Vehicle insurance use is not believed to be a good representation of the loss exposure for this rating classification.

External data to support ratemaking: The figure below provides a jurisdictional scan of vehicles for hire rates in other jurisdictions. As shown in the figure, the average vehicles for hire rate is approximately 8% to 25% higher than the all-purpose rate.

Figure 2: Summary of Jurisdictional Review of VFH premiums

Line No.	City	Base Rate	TNC Endorsement (per year)	% Over Base Rate
1	Calgary	$3,251	$500-$800	15%-25%
2	Edmonton	$3,410	$500-$800	15%-23%
3	Toronto	$6,593	$1,000 - $1,600	15%-24%
4	Montreal	$2,267	$190	8%

Proposed 2018/19 Passenger Vehicles for Hire Rates: Given the lack of MPI data on Passenger vehicles for hire loss experience, the proposed initial rates for Passenger vehicles for hire have been set based on the *percentage* difference between All Purpose and Passenger vehicles for hire rates used in other jurisdictions (as shown above). This 'percentage increase' method was assumed to best reflect the difference in coverage and loss experience in Manitoba. The Level 4 (i.e. 24/7) Passenger VFH was judgmentally set at 20% above the current Private Passenger All Purpose rate for

[3] Based on MPI's analysis of literature, other jurisdictions, and discussions with the industry

corresponding vehicle type and rate group. The rates for Levels 1, 2, and 3 Passenger vehicles for hire were uniformly decreased on the assumption that the additional risk from Passenger vehicles for hire approaches the Private Passenger All Purpose rate as the number of time bands decreases. The rates are shown in the figure below:

Figure 3: Percentage Premium Increase by Number of Time Bands

Line No.	Number of Time Bands	Rate
1	**1**	All Purpose + 5%
2	**2**	All Purpose + 10%
3	**3**	All Purpose + 15%
4	**4**	All Purpose + 20%

VFH.3.2 Taxicab Vehicles for Hire

Definition: Taxicab vehicles for hire means a vehicle for hire that is a passenger vehicle that is equipped with a taximeter.

What is changing from a ratemaking perspective? Taxis will now be able to select time bands based on when they operate (i.e. Levels 1, 2, 3, and 4). Taxis will now be able to receive Driver Safety Rating (DSR) vehicle premium discounts, if registered as an individual customer. The deductible for Taxis will decrease from $600 to $500.

Current Rates: Taxi/Livery Passenger Vehicles (i.e. Taxis) are currently flat rated by territory based on their historical loss experience. DSR vehicle premium discounts are not available.

Ratemaking Assumptions:

- There will be an as yet undetermined reduction in loss exposure for taxis as a result of competition from Passenger vehicles for hire.
- The exposure for taxis is always greater than the All Purpose Passenger Vehicle use for the same vehicle, even for taxis selecting the lowest level i.e. Level 1.

Internal data to support ratemaking: MPI has several decades of taxi claims experience that is currently used to set Taxi/Livery Passenger Vehicle rates.

External data to support ratemaking: None.

Proposed 2018/19 Taxicab Vehicles for Hire Rates:

MPI set the Taxicab vehicles for hire Level 4 (i.e. 24/7) base rate equal to the PUB approved 2018 Taxi/Livery Passenger Vehicle base rate. To determine the base rates for Taxicab vehicles for hire Levels 1, 2, and 3, MPI first performed a percentage weighting between (i) the 2018 approved Taxi/Livery Passenger Vehicle base rate and (ii) the average All Purpose Passenger Vehicle base rate for the four most recent model years. This calculation is shown in the figure below for Territory 1:

Figure 4: Taxicab VFH Blended Rate for Territory 1

Line No.	# of Levels Purchased	Territory 1 Taxi Base Rate	Taxi Weight	Territory 1, All Purpose, Newest 4 Model Years, Average Base Rate	All Purpose Weight	Blended Rate
1	4	$10,358	100%	$1,882	0%	$10,358
2	3	$10,358	75%	$1,882	25%	$8,239
3	2	$10,358	50%	$1,882	50%	$6,120
4	1	$10,358	25%	$1,882	75%	$4,001

MPI then compared the blended rates for Levels 1, 2 and 3, to the blended rate for Level 4 to determine the percentage reduction for the lower levels. This calculation is shown in the figure below for Territory 1:

Figure 5: Taxicab VFH Reduction by Level for Territory 1

Line No.	# of Levels Purchased	Blended Rate	Reduction from Level 4 Blended Rate	Selected Reduction from Level 4 Blended Rate
1	4	$10,358	0.00%	0.00%
2	3	$8,239	-20.50%	-20.00%
3	2	$6,120	-40.90%	-40.00%
4	1	$4,001	-61.40%	-60.00%

The figure below shows the selected percentage reduction for Taxicab vehicles for hire by territory and vehicles for hire level:

Figure 6: Selected Percentage Reduction for Taxicab VFH by Territory and VFH Level

Line No.	# of Levels Purchased	Territory 1	Territory 2	Territory 3	Territory 4
1	4	0.00%	0.00%	0.00%	0.00%
2	3	-20.00%	-17.00%	-18.00%	-18.00%
3	2	-40.00%	-34.00%	-36.00%	-36.00%
4	1	-60.00%	-51.00%	-54.00%	-54.00%

To recognize that the Taxicab vehicles for hire use may have lower loss exposure than the current Taxi use, it was judgmentally assumed that the availability of DSR vehicle premium discounts and the reduction in the Basic deductible would offset this reduced loss exposure. MPI is also optimistic that using DSR will encourage safer driving and potentially reduce loss exposure going forward.

VFH.3.3 Limousine Vehicles for Hire

Definition: Limousine (Limo) vehicles for hire means a vehicle for hire that is passenger vehicle having an extended wheelbase or is designed by the manufacturer as a luxury or specialized passenger vehicle that is not equipped with a taximeter and is operated for hire by a limousine or private car service, including sightseeing tours.

What is changing from a ratemaking perspective? Limousines will now be able to select time bands based on when they operate (i.e. Levels 1, 2, 3, and 4). Limousines will now be able to receive DSR vehicle premium discounts, if registered as an individual customer. The deductible for Limousines will decrease from $600 to $500.

Current Rates: Limousine All Uses (i.e. Limos) are currently flat rated by territory based on their historical loss experience. DSR vehicle premium discounts are not available.

Ratemaking Assumptions: Similar to Taxis, MPI has assumed that there will be some loss of market share (particularly in Winnipeg) as a result of the introduction of Passenger vehicles for hire.

Internal data to support ratemaking: MPI has several decades of limousine claims experience that is currently used to set Limousine All Uses rates.

External data to support ratemaking: None

Proposed 2018/19 Limousine VFH Rates:

Territory 1:

For territory 1, MPI set the Limousine vehicles for hire Level 4 (i.e. 24/7) base rate equal to the PUB approved 2018 Limousine All Uses base rate. To determine the base rates for Limousine vehicles for hire Levels 1, 2, and 3, MPI first performed a percentage weighting between (i) the 2018 approved Limousine All Uses base rate and (ii) the average All Purpose Passenger Vehicle base rate for the four most recent model years. This calculation is shown in the figure below:

Figure 7: Limousine VFH Blended Rate for Territory 1

Line No.	# of Levels Purchased	Territory 1 Limo Base Rate	Limo Weight	Territory 1, All Purpose, Newest 4 Model Years, Average Base Rate	All Purpose Weight	Blended Base Rate
1	4	$3,203	100%	$1,882	0%	$3,203
2	3	$3,203	75%	$1,882	25%	$2,873
3	2	$3,203	50%	$1,882	50%	$2,543
4	1	$3,203	25%	$1,882	75%	$2,212

MPI then compared the blended rates for Levels 1, 2 and 3, to the blended rate for Level 4 to determine the percentage reduction for the lower levels. This calculation is shown in the figure below:

Figure 8: Limousine VFH Reduction by Level for Territory 1

Line No.	# of Levels Purchased	Blended Rate	Reduction from Level 4 Blended Rate	Selected Reduction from Level 4 Blended Rate
1	4	$3,203	0.00%	0.00%
2	3	$2,873	-10.30%	-10.00%
3	2	$2,543	-20.60%	-20.00%
4	1	$2,212	-30.90%	-30.00%

To recognize that the Limousine vehicles for hire use may have lower exposure than the current Limousine All Uses insurance use, we judgmentally assumed that the availability of DSR vehicle premium discounts and the reduction in the Basic deductible would offset the reduced loss exposure. MPI is also optimistic that using DSR will encourage safer driving and potentially reduce loss exposure going forward.

All Other Territories:

There are currently fewer than 30 limos in the rural territories. MPI has assumed that overall loss exposure will not change. To determine rates, MPI judgmentally assumed that a 5% rate reduction from the Limousine vehicles for hire Level 4 rate was appropriate for each decrease in Limousine vehicles for hire level. For example, the rate for Limousine vehicles for hire Level 2 will be 10% lower than the rate for Limousine vehicles for hire Level 4. Based on this assumption, MPI then set the Limousine vehicles for hire base rates at each level as a percentage of the current Limousine All Uses base rate such that the *average* of the four levels was equal to the Limousine All Uses base rate. The figure below shows the percentage of the current Limousine All Uses base rate by Limousine vehicles for hire levels.

Figure 9: All Other Territories Limousine VFH

Line No.	**# of Levels Purchased**	**Proposed Percentage of Limos Base Rate**
1	**4**	107%
2	**3**	102%
3	**2**	98%
4	**1**	93%
5	**Average**	100%

MPI judgmentally assumed that the higher rates for Limousine vehicles for hire at Level 3 and Level 4, combined with the loss prevention incentives of DSR, would offset the loss in revenue from the availability of DSR vehicle premium discounts and the decrease in the Basic deductible for limousines.

VFH.3.4 Accessible VFH

Definition: Accessible vehicles for hire means a passenger vehicle that is equipped with a wheelchair ramp, or lift and is operated for the transportation of persons who use a wheelchair or mobility aid, motorized or otherwise, and their escorts, but does not include vehicles owned or operated by or on behalf of a municipality to provide public transportation services.

What is changing from a ratemaking perspective? Accessible vehicles will now be able to select time bands based on when they operate (i.e. Levels 1, 2, 3, and 4). Accessible vehicles will now be able to receive DSR vehicle premium discounts. The deductible for Accessible vehicles will decrease from $600 to $500. The Accessible vehicle insurance use (currently Wheelchair Livery Bus) will now be available in rural territories.

Current Rates: Wheelchair Livery Bus are currently flat rated by declared value based on their historical loss experience. DSR vehicle premium discounts are currently not available. The Wheelchair Livery Bus insurance use is only applicable to accessible vehicles in territory 1.

Ratemaking Assumptions: MPI has assumed there will only be very minor changes in loss exposure for Accessible vehicles for hire because of the unique nature of this insurance use.

Internal data to support ratemaking: MPI has several decades of accessible vehicles claims experience that is used to set Wheelchair Livery Bus rates.

External data to support ratemaking: None.

Proposed 2018/19 Accessible VFH Rates:

Territory 1:

MPI has assumed that overall loss exposure will not change. To determine rates, MPI judgmentally assumed that a 5% rate reduction from the Accessible vehicles for hire Level 4 rate was appropriate for each decrease in Accessible vehicles for hire level. For example, the rate for Accessible vehicles for hire Level 2 will be 10% lower than the rate for Accessible vehicles for hire Level 4. Based on this assumption, MPI then set the Accessible vehicles for hire base rates at each level as a percentage of the current Wheelchair Livery Bus base rate (by declared value) such that the *average* of the four levels was equal to the Wheelchair Livery Bus base rate. The figure below shows the percentage of the current Wheelchair Livery Bus base rate by Accessible VFH levels.

Figure 10: Territory 1 Accessible VFH

Line No.	# of Levels Purchased	Proposed Percentage of Wheelchair Livery Bus base rate
1	**4**	107%
2	**3**	102%
3	**2**	98%
4	**1**	93%
5	**Average**	100%

MPI judgmentally assumed that the higher rates for Accessible vehicles for hire at Level 3 and Level 4, combined with the loss prevention incentives of DSR, would offset the loss in revenue from the availability of DSR vehicle premium discounts and the decrease in the deductible for Accessible VFH.

All Other Territories:

Given that rates are currently not available for Wheelchair Livery Bus for Territories 2, 3, and 4, in order to set rates for Accessible vehicles for hire for these territories, MPI applied the territory relativities for the Public Major Class as presented in the 2018 GRA, Volume II, Ratemaking, Appendix 9. The figure below shows the territory

relativities and the percentage of Territory 1 Accessible vehicles for hire rates applicable to Territories 2, 3 and 4.

Figure 11: Accessible VFH for Territories 2, 3 and 4

Line No.	Territory	Public Major Class Territory Relativity	Percentage of Territory 1 Accessible VFH Rate
1	**1**	1.1857	100.00%
2	**2**	0.6133	52.00%
3	**3**	0.6772	57.00%
4	**4**	0.7199	61.00%

VFH.3.5 How Rates will be set in future GRAs

MPI will use the currently approved PUB ratemaking methodology to adjust the required rates for each of the vehicles for hire uses (i.e. Passenger, Taxi, Limo, and Accessible). MPI will then perform a separate relativity calculation within each of these vehicles for hire to determine the relative rates by Level (i.e. 1, 2, 3, 4). By setting rates based on the overall vehicles for hire experience in each VFH use (rather than for each level separately) there will be more credible data for which to modify rates.

VFH.3.6 Vehicles for Hire 2017/18 Rates

As a result of staggered renewals, many customers will still have rates from the 2017/18 policy year in effect at the time the vehicles for hire insurance uses come into effect. As a result, MPI has prepared the 2017/18 equivalent rates for each of the new insurance uses described above. The methodology utilized to calculate the 2017/18 vehicles for hire rates is identical to the methodology used to calculate 2018/19 rates, except using 2017/18 PUB approved rates. These rates are presented in Appendix 2 to this Application.

VFH.3.7 Eligibility for Driver Safety Rating Vehicle Premium Discounts

All individual vehicles for hire customers will be eligible for a DSR discount. Therefore, individual customers who choose to be vehicles for hire drivers will not lose their DSR discount as a result of changing their vehicle insurance use to vehicles for hire. Eliminating the DSR discount for these customers would be unfair and create a barrier to entry into the vehicles for hire market. Further, allowing the DSR discount for all individual vehicles for hire customers is consistent with the goal of establishing fair and equitable rates across the vehicles for hire pool, and expands the availability of DSR vehicle premium discounts to formerly 'x-plated' vehicles, enhancing the incentive to drive safely, move up the DSR scale, and increase their vehicle premium discount.

The DSR vehicle premium discount remains unavailable to corporate customers.

VFH.3.8 Impacts Taxi/Livery Policies Outside the VFH Framework

The dissolution of the Taxicab Board and the VFH Act vehicle-for-hire definition results in certain outliers. Previously 'x-plated' taxi/livery vehicles with seating capacity of 11 or more are not captured under the VFH Act, and do not qualify for vehicles for hire insurance policies. However these vehicles must still change registration class and insurance use due to the discontinuance of the 'x-plated' registration class. Based on the customer's declared use of the vehicle, existing registration classes such as Regulated Passenger Vehicle (AR) and Public Service Vehicle (PSV) and existing insurance uses such as Common Carrier, Charter Bus – Local, Disabled Persons Bus, and Private/Business Bus will be used for vehicles that fall outside of the Act vehicle for hire definition. It is anticipated that fewer than 100 policies will be affected and though there may be changes in premiums charged, in the vast majority of cases it is expected that there will not be a negative financial impact to these customers. MPI will work in coordination with the Province of Manitoba to communicate the changes to existing taxi/livery policy holders.

VFH.4 CUSTOMER SERVICE

Vehicles for hire insurance will be available for purchase at brokers and MPI service centers. Previously taxi/livery insurance was only available at MPI service centers, and these customers were required to provide proof of Taxicab business licence (including seasonal licenses/permits and bill of sale for the licence) and Certificate of Inspection or Periodic Mandatory Vehicle Inspection certificate. Under the new vehicles for hire insurance offering these supporting documents will no longer be required to receive vehicle for hire insurance. Customers will still be required to sign a policy declaration to confirm their intended use and provide documentation consistent with registering an A1/A5 vehicle. These changes will improve access for customers and allow for the casual uptake of vehicle for hire operation.

VFH.4.1 Implementation Plan

Currently there are less than 1000 taxi, limousine and wheelchair/accessible vehicles with 'X-plate' class registration on the road today. Vehicles that fall under the definition of vehicle-for-hire, as set out in the VFH Act, are eligible to purchase a new vehicles for hire insurance use policy and self-select their desired operating time band(s). This includes vehicles with a seating capacity of 10 or fewer occupants (including the driver), hired on a single trip basis where the passenger controls the destination/route. These vehicles will transition to A1 passenger vehicle registration class and the applicable vehicles for hire insurance.

Currently, the Taxicab Board regulates taxicabs, wheelchair vans and limousines operating in the City of Winnipeg as outlined in The Taxicab Act. These vehicles fall within the X1 Taxicab, X2 Livery City or X3 Limousine City registration classes and are insured as one of the following insurance uses; Taxi / Livery, Wheel Chair Livery or Limousine All Uses.

The Motor Transport Board regulates the taxicabs operating in Manitoba outside the City of Winnipeg as outlined in The Highway Traffic Act (section 23). These vehicles

fall within the A1 Passenger Vehicle or X4 Livery Country registration class and are insured as one of Taxi / Livery or Limousine All Uses insurance uses.

Currently, X1 Taxicab, X2 Livery City, X3 Limousine City and X4 Livery Country vehicles must be registered at a MPI Commercial Vehicle Registration location. There is no restriction on a taxi/livery vehicle's designed seating capacity. These vehicles are issued Livery plates ('x-plates') and must be renewed annually.

The 'x-plate' registration classes and associated insurance uses (Taxi/livery, Limousine All-Use, and Wheelchair Livery) will be expired in coordination with the Government of Manitoba. All vehicles in these categories will need to transition into one of the new vehicle for hire insurance uses (unless the vehicle is an outlier, as explained in section VFH.3.8). The 'x-plate' registration classes and taxi/livery insurance uses will no longer be available for sale as of April 30th 2018. This date was selected to allow for the run off of policy renewals.

Effective March 1, 2018, existing taxi/livery vehicle customers as well as regular Manitobans can visit a broker or MPI service centre and purchase vehicles for hire insurance. The transition from taxi/livery vehicle to VFH will be forced at the customer's next vehicle renewal. Therefore it may take up to 1 year after March 1, 2018 for the transition to complete. Taxi/livery vehicle customers can visit a MPI agent prior to their renewal date to change to vehicles for hire insurance. MPI believes that existing taxi/livery vehicle customers will recognize the advantage of transitioning their insurance to one of the new vehicles for hire subcategories. For example, individual customers purchasing vehicles for hire insurance use are eligible for a DSR discount, and a $500 Basic deductible.

VFH.4.2 Rating Model Enforceability

The customer selected 'time band(s)' will be depicted in an addendum to the current vehicle registration and insurance certificate which is used by the customer to provide evidence of valid vehicle registration, insurance and where applicable, confirmation of valid vehicle for hire insurance based on the time of day. The time band information

will also be available to MPI's claims administration staff for instances whereby a vehicle for hire automobile experiences a claim. The vehicle insurance information as well as the time of day of the incident, witness/passenger statements as well as data available via Manitoba municipalities will be utilized by MPI claims administration staff in order to confirm valid insurance coverage on the vehicle.

VFH.5 FINAL APPROVAL OF VFH RATES

MPI proposes that the final determination of VFH rates will take place as part of the 2019 GRA. MPI will bring an application for 2017/18 and 2018/19 rates for service, as contained in this interim application, as well as 2019/20 vehicles for hire rates for service, consistent with the rest of the GRA. The PUB's final determination on 2017/18 and 2018/19 rates would be contained in the 2019 GRA Order, and any variance between interim and final approval of rates would be rebated or collected, as explained further in section VFH.5.1 below.

All interveners, interested parties and the public at large will be able to adequately challenge the rates for service during the 2019 GRA. Parties with standing will be able to test the evidence and bring their case to the PUB for determination of final vehicles for hire Rates for Service. Any potential prejudice to intervenors or interested parties, as a result of this interim application and its expedited process, is alleviated by adequate alternative remedy in the 2019 GRA.

VFH.5.1 Refund/Collection Mechanism for Final Approved Rates

Further, parties to the proceeding can have confidence that any variance between interim and final rates will be accurately refunded or rebated to affected ratepayers.

MPI currently has an automated process to trigger a 're-rating' of an insurance policy without requiring a customer visit to a broker or service centre. If the PUB approves final vehicles for hire Rates for Service for the 2017/18 and 2018/19 insurance years that differ from those approved on an interim basis, MPI will identify all vehicles for

hire customers and initiate a re-rating of the insurance policy. This will complete a new insurance rating calculation process and the new approved rates will be used to determine the appropriate insurance premium that should have been collected.

In the event of either an increase or reduction in premium, the associated balance will be applied to the respective customer account and a letter will be sent to each customer explaining the amount due or credit on the customer account will be produced and sent to the customer for follow-up action.

2018 BASIC RATE TABLE

TERR	DISC %	INSURANCE USE DESCRIPTION	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40

Winnipeg Free Press

Business booming for local ride-hailing companies

TAXI INDUSTRY IN UPSET DUE TO INDUSTRY RESTRICTIONS

By: Ryan Thorpe
Posted: **04/30/2018 5:48 PM**

BORIS MINKEVICH / WINNIPEG FREE PRESS

Taxi drivers protest at City Hall about working conditions and abuse on the job.

Two months after their drivers first hit the road, local ride-hailing companies say business is good in Winnipeg and, if anything, is getting even better.

"I would say things have been anything but quiet. The market has been growing from the beginning of us getting our services on the road. Our top day for rides fell on a (Winnipeg) Jets (NHL playoff) game. We saw almost 3,000 rides that day," said TappCar Inc. spokesman John Morris.

"We're experiencing a high volume of demand with people attending the game, the Whiteout street parties, or just the downtown in general. The deeper the Jets go in the playoffs, the better the business is for TappCar."

Ride-hailing services were officially introduced in the province March 1. Since then, two — Edmonton-based TappCar and Calgary-based Cowboy Taxi Ltd. — have rolled out their Winnipeg operations. TappCar has roughly 250 drivers on Manitoba's roads, while Cowboy Taxi has 34 active drivers, according to spokesmen for the companies.

Two other ride-hailing services — local startup U2Go and Toronto-based Instaryde — had previously indicated they're looking to break into the Winnipeg market, but have yet to get operations up and running. According to its website, U2Go is eyeing a May launch date.

MIKAELA MACKENZIE / WINNIPEG FREE PRESS
Ride hailing company TappCar began operating in Winnipeg in early March. The company is now up to about 100 drivers.

The rise of the ride-hailing services in Manitoba comes in the midst of some chaos in the traditional taxi industry.

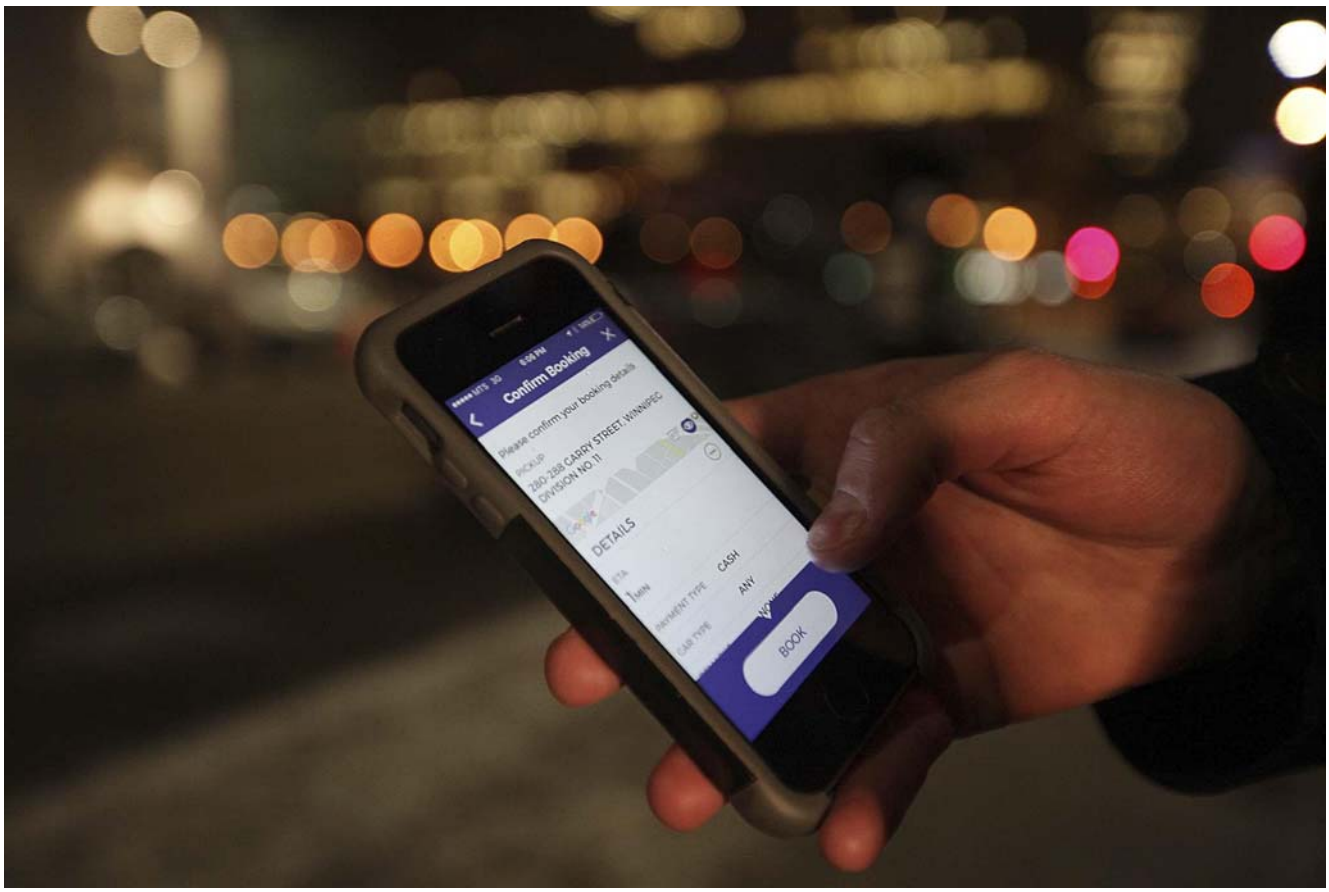
On Thursday, hundreds of Winnipeg cab drivers demonstrated at Polo Park shopping centre, before gathering again Friday afternoon at city hall, to protest — in part — restrictions from taxi industry owners who don't want them picking up part-time work with local ride-hailing services.

Cowboy Taxi has received more than 500 driver applications, according to owner Mo Benini (although it remains unclear how many of them are also employed with one of the city's taxi companies). When asked why Cowboy Taxi only has 34 drivers when it has received hundreds of applications, Benini cited selectiveness on his part, as well as a lack of paperwork by many of the applicants.

"We want to make sure we get the right drivers. They also have to have all of the right documents. We know there are some drivers who think they can work because they've been approved elsewhere, but that don't actually have the right documents," Benini said.

"But, overall, things have been good. We think Winnipeg is more driver-friendly and business-friendly than other (jurisdictions). There's a level playing field here. We're looking to bring on more drivers. We're activating drivers by the day or by the week, and deactivating others who aren't doing what they're supposed to."

As it currently stands, industry big shots Uber Technologies Inc. and Lyft Inc. remain on the outside looking in two months after Manitoba's Local Vehicles for Hire Act went into effect. The industry giants have rebuffed Manitoba Public Insurance's plan for ride-hailing service drivers, saying it makes operating in the province economically unfeasible.



RUTH BONNEVILLE / WINNIPEG FREE PRESS FILES
Local ride-hailing services feel a deep playoff run by the Winnipeg Jets is good for business.

That stance has left a market vacuum lesser-known outfits are happy to try and fill.

Benini counters Uber and Lyft's claims, saying rather than getting it wrong, MPI got its insurance policy right. The fact MPI didn't bend over backwards for Uber and Lyft is why those companies have, so far, refused to come to Manitoba, he said.

"They made the fairest insurance product in Canada, compared to what each of the other provinces did," Benini said.

However, Cowboy Taxi's owner does have one complaint about the rules governing ride-hailing in Winnipeg: under the city's vehicle-for-hire bylaw, ride-hailing companies are allowed to accept bookings online or through their apps, but not over the phone. Benini said phone booking shouldn't be the exclusive right of taxi cab companies and he'd like to see that restriction lifted.

"Someone should be able to book with us through their phone, whether they want to call, use the app, or book online. We've had lots of people who've tried to call to make a booking, but we can't take phone bookings," he said.

"We ask them to download the app, but some of them don't. They prefer calling... I think that rule is the only disadvantage to business in Winnipeg, because in other areas, we're allowed phone bookings."

‘We need more drivers’: Rideshare company looking to add more cars to Winnipeg roads

By Brittany Greenslade
Senior Reporter/Anchor Global News

TappCar officially launched in Winnipeg.

Global News

It’s been two months since new ride sharing services rolled out in Winnipeg.

ADVERTISEMENT

Winnipeg currently has two different options: Calgary-based Cowboy Taxi and Edmonton-based TappCar.

READ MORE: Winnipeg ridesharing: TappCar Vs. Traditional cab

TappCar said its drivers are so busy they need to look at getting more on the road.

> “It’s been going fantastic,” Spokesperson John Morris said. “Since March 2 we’ve had over 30,000 rides provided. We started with less than 50 drivers and now we are up to about 250 drivers. We need more drivers.”

Morris said the company hit a milestone this month during the playoffs.

"Those Jets nights have been fantastic in terms of rides provided," Morris said. We had at a peak 3,000 rides in one evening because of a Jets game."

WATCH: Winnipeg taxis make changes ahead of ride sharing competition

Cowboy Taxi Ltd. CEO Mo Benini said his company currently has nearly 50 drivers on the road in Winnipeg.

Benini said businesses was slow at the start as many users were mistakenly downloading the Calgary app and were unable to book rides.

"It was a bit of a hiccup," he said. "We're taking baby steps."

But the company said when business speeds up they will be ready to go.

> "We have close to 50 drivers," Benini said. "We have around 70 that are pre-approved but we haven't activated them yet because we don't have enough business to add those drivers on."

Legislation was passed in November to make ride sharing legal in Manitoba, with March 1 being the date when companies could put their drivers on the road.

According to a new survey released by Prairie Research Association Wednesday, 83 per cent of Winnipeggers reported being aware of the services but only 1 per cent had used them.

The survey also stated that younger adults, aged 18 to 29, are the least likely to be aware of the services.

DRIVER SAFETY RATING

DSR.1 INTRODUCTION

Manitoba Public Insurance (MPI or the Corporation) introduced the Driver Safety Rating (DSR) system in 2010 to replace the Merit Discount Program (bonus/malus). The DSR system was made possible by the merger between the provincial Department of Driver and Vehicle Licensing (DDVL) and MPI in 2004 and the resultant integration of licensing with vehicle registration and insurance. The *Driver Safety Rating System Regulation* is prescribed in Manitoba Regulation 13/2009 and was registered on January 21, 2009. Several changes designed to improve the DSR system, mainly to charge more appropriate rates based on driver risk, have been implemented over the years. The Corporation continues to monitor the experience of drivers at various DSR levels, and provide adjustments to the system as necessary to ensure that risk is reflected in driver and vehicle premiums under the DSR scale. Adjustments to the DSR will continue to be considered to allow for stable and predictable rates into the future.

DSR.2 PUBLIC UTILTIES BOARD ORDER NO. 130/17

In the 2018 GRA, MPI applied for an increase in driver premium revenues of $17.5 million, equivalent to an overall premium revenue increase of 1.8%[1]. The proposed changes applied only to driver premiums on the demerit side of the DSR scale.

Although the proposed premiums were determined on a policy basis rather than on an actuarial basis, they are guided by the statistical information available. MPI expected this policy decision to:

1. Reduce the rate indication for Basic vehicle premiums

[1] Manitoba Public Insurance 2018 Rate Application Volume 1, June 16, 2017, page 3 of Legal Application

2. Reduce the largest negative discrepancy between premiums paid per driver (both vehicle and driver premiums) and the claims costs per driver at each DSR level

3. Further incentivize better driver behaviour, thereby improving the road safety and loss prevention strategies

The Public Utilities Board (the Board) recognized the importance of providing disincentives for engaging in high-risk driving behaviour and maintaining public confidence in the fact that riskier drivers will pay more than safe drivers. The Board agreed in principle that there should be a change to the DSR Scale and that drivers on the merit side should not be assessed an increase in premiums. However, the Board also expressed its concern regarding the lack of actuarial evidence supporting MPI's evaluation of driver risk and set out its expectation that MPI will use robust analytical tools and provide statistically driven, performance-based evaluations to support requests for changes to driver premiums and vehicle premium discounts in future Rate Applications.

Consequently, the Board issued the following directives related to the DSR:

11.7 There shall be a Technical Conference, facilitated by the Board, on the availability and practicality of other analytical tools and ratemaking methodologies to better determine DSR rates and vehicle premium discounts based on principal driver rating rather than simply registered driver rating. The date of the Technical Conference is to be mutually agreed upon as between the Board and MPI, but shall be sufficiently early such that the information shared in the Technical Conference will be included in the 2019 GRA.

11.8 In the 2019 GRA, the Corporation shall file proposed driver premium rates that are more statistically consistent with the estimated average claims cost per driver for each level on the demerit side of the DSR scale.

11.9 In the 2021 GRA, the Corporation shall file proposed vehicle premium discounts that are actuarially indicated based on principal driver performance evaluation

DSR.3 PUBLIC UTILTIES BOARD ORDER NO. 29/18 (APPLICATION FOR REVIEW AND VARIANCE OF ORDER NO. 130/17)

MPI believed that the Board did not fully consider in the 2018 GRA, the implications of requiring the DSR Scale to be based on actuarial evidence as well as on the principal driver rating as opposed to the registered owner rating. The Corporation took the position that, while changes to the framework of the DSR Scale may ultimately be appropriate; changes should only be made after considering all of the evidence. Accordingly, MPI sought a review of Board Order No. 130/17 and proposed a variance by replacing Directives 11.7 to 11.9 with the following:

1. A Technical Conference be held prior to the filing of the 2019 GRA which will explore:

    a) The mechanics of the current Driver Safety Rating program, including information related to using the registered owner's driving rating, as opposed to primary driver, to establish vehicle premium discounts; and

    b) The availability and practicality of other analytical tools and ratemaking methodologies to determine DSR rates and vehicle premium discounts based on principal driver rating rather than registered driver rating.

2. In the 2019 GRA, MPI will file a review of the existing Driver Safety Rating program and an assessment of available and practical analytical tools and ratemaking methodologies, incorporating information and positions identified at the Technical Conference, so that the Board can be updated on the matter and make any inquiries it deems necessary;

3. Prior to the 2020 GRA there shall be a second Technical Conference to consider the extent of possible changes, if any, to the Driver Safety Rating program, and a timeline for implementation.

The Board considered the Application for a Review and Variance of Order No. 103/17 and concluded in Order 29/18 that, although MPI did not provide any information in its application that persuaded the Board that MPI is prevented from moving to driver premiums more statistically consistent with the average claims cost per driver for each level on the demerit side of the DSR scale, and eventually to vehicle premium discounts that are fully supported by actuarial indications based on principal driver performance evaluation.

However, the Board noted that these issues have yet to be fully assessed. As a result, the Board allowed the Application and varied Directives 11.8 and 11.9 (Order No. 29/18), holding them in abeyance pending further examination in the 2019 GRA.

DSR.4 DSR TECHNICAL CONFERENCE

The DSR Technical Conference was held on March 20, 2018.

MPI interpreted the essence of PUB Order No. 130/17 as follows:

- *MPI's Interpretation*: MPI needs to improve the actuarial soundness of the DSR-based driver premiums and vehicle premium discounts calculations, which are currently set by policy.

  MPI's Position: MPI agrees that actuarially sound rates (possibly with some policy-based adjustments/considerations) should be the objective for ratemaking.

- *MPI's Interpretation*: Any rating variable that is used in the determination of rates should be fully supported by MPI with a strong statistical framework.

MPI's Position: MPI agrees that DSR rating variables should be supported with a strong statistical framework similar to that used for the rating of territory, insurance use, rate group, etc.

- *MPI's interpretation*: This improved DSR-based ratemaking methodology should be based on 'principal driver performance evaluation'.

  MPI's position: The Corporation understands the rationale for this request, but does not yet fully support this concept.

DSR.4.1 DSR-based Vehicle Premium Discounts

A vehicle's premium discount on the policy, under the current model, is based on the DSR level of the registered owner regardless of how many other drivers drive the vehicle. Assuming that the highest rated DSR driver in a household will insure all vehicles, the "registered owner" model underestimates driver risk for all other driver/vehicle scenarios as the remaining drivers in the household will, by definition, have the same or higher risk as the registered owner.

However, similar to other rating variables such as insurance use, territory, and rate group, DSR is a rating variable that can form the basis of an actuarially sound rate calculation. The relative risk by DSR level has been very stable since the implementation of DSR and this rating variable is reliable from a statistical perspective. DSR vehicle premium discounts could be part of a relativity calculation similar to what the Corporation uses for rate groups.

DSR.4.2 DSR-based Driver Premium

The collection of driver premiums as part of an actuarially sound ratemaking methodology is largely unique to MPI since private insurers cannot collect these premiums. MPI has to consider whether it wants the ratemaking methodology to align closer with private sector practices (e.g. list drivers on the vehicle policy) or whether it

wants a more unique to Manitoba solution (e.g. collecting more premiums on the driver license).

The DSR driver premiums are not priced to be 'penalties '. A customer's DSR-level is a rating indicator and the Corporation does not intend to charge any more than necessary to cover the expected risk.

Depending on the DSR-based vehicle premium discount system implemented, the driver premiums would in theory be used to collect any 'residual risk' premium amounts that are not adequately collected from the vehicle premium system. This residual risk calculation could be part of an actuarially sound ratemaking methodology. Residual risk arises because, under the current model, some drivers have vehicles registered to them while others do not and, depending on the rating system used, it may be appropriate to charge different driver premiums based on whether or not the customer registers a vehicle.

DSR.4.3 Alternatives

Several alternatives to the Registered Owner Model were presented and discussed at a high level in the Technical Conference. For each of these alternatives, further detailed analysis would be required before a recommendation can be made. It is also anticipated that there would be a significant rate change, regardless of the model, if DSR was used as a rating variable and the model followed accepted actuarial practice. Therefore, for any of the proposed models, a phase-in strategy would be necessary.

1. Primary Driver Model

   Under the Registered Owner Model, MPI does not require policyholders to identify the primary driver of the vehicle and, as a result, MPI does not have any current or historical driver data. MPI cannot analyze the merits of a Primary Driver Model at this time because it requires primary driver information to perform the analysis. Standardized address data would also aid in the analysis by showing the cost/benefit of a Primary Driver Model.

However, while MPI is currently unable to assess the effectiveness of the Primary Driver Model at this time, the larger concern is that using the Primary Driver Model is unlikely to provide any significant benefits relative to the Registered Owner Model. This is because MPI expects that customers may simply declare the best-rated driver as the primary driver for all vehicles in the household and thereby undermine the effectiveness of the Model.

2. Forced Assignment Model

Under the Registered Owner Model, MPI lacks the ability at present to easily and accurately identify all the licensed drivers in a given household. This is because the address field in MPI's data warehouse is manually entered as free-form text. If MPI could better identify these drivers, it could conduct modeling on the risks of drivers in a given household based on their combined/average DSR level and the assumption that all vehicles in the household are being equally driven. This type of modelling, although not perfect, would provide a more accurate prediction of risk than the modelling available in a Primary Driver or Registered Owner Model.

Alternatively, having better licensed driver by household data would allow MPI to assign vehicles to specific drivers. For example, the highest rated vehicle could be assigned to the driver with the highest vehicle discount; the second highest rated vehicle could then be assigned to the driver with the second highest vehicle discount and so forth. The Forced Assignment Model therefore prevents all household vehicles from being registered to the driver with the highest premium discount.

Since MPI does not currently have a comprehensive and reliable household view on any current or historical data basis, the data would need to be captured and stored before it can perform any meaningful analysis of this Model.

3. Declared Driver(s) Model

Under the Registered Owner Model, MPI does not require the policyholder to identify the regular drivers on their vehicle policy. Having a list of regular drivers could allow MPI to determine vehicle discounts based on the average DSR level of the listed drivers, based on the DSR level of the lowest rated driver or based on some other variable. As MPI has not asked customers to list the regular drivers of their vehicle, there is no historical data to analyze. This data would need to be captured and stored before any analysis of the effectiveness of the Declared Driver(s) Model could be performed.

As a result, while the Declared Driver(s) Model is more actuarially sound than the Registered Owner or the Primary Driver models, it may be the most complicated model to employ and MPI does not have the capability at this time to assess its effectiveness.

4. Residual Risk Model

Although not explicitly identified as an option at the Technical Conference, MPI discussed how improved rating of 'residual risk' in the current DSR model could make the current system more equitable. This method would ensure that drivers who do not register vehicles pay an actuarially determined driver premium based on their historic risk. The driver premium collected from these "non-owners" would then be used to lower vehicle premiums and/or improve the actuarial soundness of the vehicle premium discounts. This method also allows for the retention of the Registered Owner Model and the existing DSR framework and avoids the costs associated with implementing a new model.

DSR.5 DSR STRATEGY

MPI can improve the actuarial soundness of the DSR-based driver and vehicle premium discount calculations and agrees that any rating variable that is used in the determination of rates should be fully supported by a strong statistical framework.

MPI can also improve the DSR model is ensure that risk is better reflected in driver premiums and vehicle premium discounts under the DSR scale. These improvements will result in further disincentives for engaging in high-risk driving behaviour and customers at the top and bottom of the DSR scale will pay rates that more align to their driving behaviour.

However, MPI believes that all options should be thoroughly considered and analyzed prior to transitioning from the current Registered Owner Model to a Primary Driver or to some other type of model.

DSR.5.1 Public Consultation

The initial phase of MPI's DSR strategy is to develop a public consultation plan to invite Manitobans to share their views on the proposed changes to the driver and vehicle rating models.

The public consultation plan will identify the variety of mediums to inform and educate Manitobans, and the qualitative and quantitative research methodologies used to gather and tabulate feedback. The mediums used may include the following:

- Media Relations
- Advertising
    - Print ads
    - Radio ads
- Discussion Paper
- Website
- Quantitative Survey
    - Telephone survey
- Public Outreach

The objectives of the public consultation will include:

- To measure customer's awareness of the current Registered Owner Model

- To measure overall support of changing the current model
- To measure customer's overall acceptance/desire for a model that more closely aligns driver risk and driver/vehicle premiums (this would include improving the actuarial soundness of the existing model)
- To gain insight into potential issues or concerns of changing to an alternative model including the collection of household and driver data that will be required to conduct the analysis

The cost of the public consultation is estimated to be $50,000-$125,000. This high level estimate is based on previous consultation costs. The actual cost of the public consultation will be determined by the mediums used to gather feedback and the extent of the public consultation. MPI expects to plan and undertake this work through the balance of 2018, and tentatively plans to provide the Board with an update or results in the 2020 General Rate Application.

DSR.6 DATA COLLECTION COSTS

As previously indicated, MPI does not presently have the ability to capture the data necessary to analyze the effectiveness and the costs/benefits of the alternative DSR models discussed above. Initial estimates of the costs to gain this ability are as follows:

Primary Driver Model - $217,000

- This estimated cost is only to modify MPI's system to support the capture and maintenance of the Primary Driver data and does not include any cost associated with business or system effort to change rates or rating processes within MPI's IT system

Forced Assignment Model - $1,117,400

- This estimated cost is only to modify MPI's system to support the capture and maintenance of residence data (associated with drivers and policies) and does

not include any cost associated with business or system effort to change rates or rating processes within MPI's system

Declared Driver(s) Model - $1,160,400

- This estimated cost is to modify MPI's system to support the capture and maintenance of residence data (associated with drivers and policies) and includes adding a "role" to define the primary and secondary drivers but does not include any cost associated with business or system effort to change rates or rating processes within MPI's system

Improved Existing Model (Residual Risk) - $0

- The 'residual risk' model would not require any data collection costs

DSR.7 DSR IMPLEMENTATION COSTS

The current DSR program was implemented in 2010 at a cost of $6.8 million; based on the Bank of Canada's monthly Consumer Price Index (CPI), the $6.8 million cost would equate to $7.8 million today. The actual implementation cost of changing the current Registered Owner Model will not necessarily be $7.8 million as the cost will depend on the alternative model selected. However, the $7.8 million figure does provide an indication as to the possible implementation costs.

DSR.8 DSR STATISTICAL FRAMEWORK

The driver premiums and vehicle premium discounts on the DSR scale are currently set by policy. Recent increases to driver premiums on the demerit side of the DSR scale have been supported by an MPI analysis showing that the average claims costs for demerit drivers are the same or greater than the average premiums collected from demerit drivers. Although MPI supports the findings of this analysis, it has also informed the Board that this analysis (i) is not part of an actuarially sound ratemaking

methodology, and (ii) that the statistical data used to conduct this analysis is not subject to the same statistical framework used in the calculation of vehicle base rates.

MPI has not provided analytical support for the driver premiums on the merit side of the DSR scale or for the DSR vehicle premium discounts. The MPI analysis discussed above indicates that the driver premiums and vehicle premium discounts are 'directionally consistent' (i.e. average claims costs per driver and average premiums per driver decrease as the DSR level increases); however, MPI has not used this information as a means to apply for rate changes for drivers on the merit side of the DSR scale.

As confirmed at the DSR Technical Conference, MPI agrees with the Board that Basic rates should be actuarially sound (or at least moving toward actuarial soundness) and that any rating variable used in the calculation of rates should be supported by a strong statistical framework. At this time, MPI is conducting research on potential alternative DSR-based rating models, which research may require the collection of new statistical data (e.g. primary driver; listed drivers as discussed above) or using existing statistical data in new ways (e.g. household data). As a result, MPI cannot provide a fully developed statistical framework in the 2019 GRA. However, MPI has created the following list of general principles for the statistical framework that would be applicable to any DSR-based rating model:

1. **The DSR rating variable should be included in the Basic relativity analysis used to determine Basic rates.** The output from this change would be a DSR-based relativity analysis similar to the rate-line output for vehicle rate groups.

2. **Statistical data used for DSR-based ratemaking should be adjusted 'for ratemaking purposes' in the same manner as the statistical data used for all other Basic rating variables.** E.g. 10-year average serious losses; PIPP Cost Allocation; etc.

3. **The presentation of DSR-based statistical data to the Public Utilities Board should be at the same level of detail as that provided for other**

rating variables. The output from this change would be historical data in the appendices of the Ratemaking section.

4. **The statistical data used to produce DSR-based rate indications should be subject to appropriate credibility and rate capping rules consistent with the existing rules used for other rating variables.** DSR-based rate indications should be subject to the same data credibility and rate shock considerations that apply to other rating adjustments.

DSR.9 CONCLUSIONS AND NEXT STEPS

MPI has begun to engage in work on a number of fronts stemming from the DSR Technical Conference. MPI expects to investigate and analyze the rating models having limited or no IT costs while it engages in public consultation to assess the appetite of Manitobans for changes to the driver and vehicle rating models.

Some of the alternatives discussed above could significantly impact customers (through rate dislocation, increased IT costs, and expanded reach of data collection) as well as MPI and broker business practices. Given that impacts could be material, MPI must also consider the benefits of any change, and weigh them against the relevant costs.

MPI presently anticipates that, by the 2020 GRA, it will be in a position to report on the results of its public consultation efforts, its preliminary research on the no or low cost options as well as on its decision on whether to proceed with data collection for the higher cost options.

DRIVER CLASSIFICATION SYSTEM 3
DCS.1 Driver Premiums 5
DCS.2 Vehicle Premium Discount 7

DRIVER CLASSIFICATION SYSTEM

Effective March 1, 2010, Manitoba Public Insurance (MPI, or the Corporation) implemented the Driver Safety Rating (DSR) program as a method of classifying driver risk. The DSR program is prescribed by regulation under *The Manitoba Public Insurance Corporation Act* and replaces the previous "bonus/malus" plan.

The goals of the DSR program are to:

- Strengthen the ability to reward the safest drivers
- Encourage poor drivers to improve their driving behavior
- Enhance drivers' overall understanding of how their driving behaviour can affect how much they pay for auto insurance.

The DSR Scale runs from a maximum of +15 merits to -20 demerits, with a neutral "0" point between the two. Each year, at their renewal date, drivers either move up the scale or down the scale based on their driving history during the last year. Drivers in the DSR merit zone move up the scale by one level whenever they complete a full year of driving without any at-fault claims and eligible traffic violations.

As an incentive to improve, drivers in the DSR demerit zone are able to move up faster if they maintain a valid driver's licence for a minimum of 335 days and demonstrate a change in driving behavior. For example, a driver with 20 DSR demerits moves up 7 levels if he/she goes a full year without any at-fault claims and eligible traffic violations. If the driver continues to drive incident-free, he/she can return to DSR 0 level within five years. The following table shows the upward movement for a full year of incident-free driving.

Figure DCS-1: DSR Movement Table

Line No.	DSR Level	Movement with clean year with active licence	DSR Level	Movement with clean year with active licence
1	1 to 15 merits	1 level up	-10	4 levels up
2	0	1 level up	-11	4 levels up
3	-1	1 level up	-12	5 levels up
4	-2	2 levels up	-13	5 levels up
5	-3	3 levels up	-14	5 levels up
6	-4	3 levels up	-15	5 levels up
7	-5	3 levels up	-16	6 levels up
8	-6	3 levels up	-17	6 levels up
9	-7	3 levels up	-18	6 levels up
10	-8	4 levels up	-19	7 levels up
11	-9	4 levels up	-20	7 levels up

Drivers move down the scale if they have had one or more eligible traffic violations or at-fault claims. For traffic violations, the number of levels they move down depends on the severity of the violation (2 to 15 levels down). An at-fault claim moves a driver five levels down the DSR scale.

There are no changes in 2019/20 to the number of DSR levels or the manner in which drivers move up and down the DSR scale.

Full details of the DSR program can be found in the *Driver Safety Rating System Regulation*, at http://web2.gov.mb.ca/laws/regs/current/_pdf-regs.php?reg=13/2009

DCS.1 DRIVER PREMIUMS

A basic insurance premium is charged on every Manitoba driver licence to ensure that all Manitoba drivers share the costs of compensating victims of accidents. Drivers on the merit side of the DSR scale pay a lower Driver Premium than drivers on the demerit side of the scale. Driver Premiums for the DSR demerit levels followed the phased-in approach presented to the Public Utilities Board (PUB) in April 2009, which was completed with the 2013/14 Rate Application. From 2013/14 to the 2017/18 Rate Application, Driver Premiums were unchanged. In the 2018/19 Rate Application, the PUB approved the Corporation's recommended increases to the Driver Premiums on the demerit side of the DSR scale.

In the 2019/20 Rate Application, the Corporation is not proposing any changes to the Driver Premiums.

The following table shows the Driver Premiums since the implementation of DSR.

Figure DCS- 2: Driver premiums approved since the implementation of DSR

Line No.	DSR Level	2010/11	2011/12	2012/13	2013/14 to 2017/18	2018/19	Proposed 2019/20

VEHICLE CLASSIFICATION SYSTEM

VCS.1 INTRODUCTION

Standard insurance industry practice uses a classification plan to assign individual insurance risk, which is the vehicle unit, into groups sharing similar risk characteristics. The classifications used are prescribed in Regulation under *The Manitoba Public Insurance Act*.

A risk classification plan is needed because a meaningful statistical measure of risk cannot be derived on a per vehicle unit basis. It is necessary to combine units that are expected to have the same risk together, in order to derive a statistically valid measure of the risk, its cost, and subsequently the rate that should be charged. The same rate is then applied to all units in that group. In this manner, the rate paid as a group accommodates the costs incurred as a group.

A risk classification plan is designed based on statistical, operational, social and legal criteria. Statistically, a classification system must be stable and allow for history to reflect expected costs. Operationally, a classification must be practical and easily identifiable. For example, insurance use is easily determined since it relates to how the vehicle will be primarily used. Social and legal considerations include factors such as evolving legislation and social norms around fairness.

For Basic Autopac, the vehicle classification plan closely follows normal industry practice. Vehicle units are grouped together using the following classifications; rating territories, insurance uses, vehicle rating factors and driving records.

Details on classification adjustments for 2019/20 and their impact on customer rates can be found in *Part V(ii) RM Ratemaking*.

VCS.2 RATING TERRITORIES

The province is divided into four geographical rating territories. An additional rating territory, commuter, is based on an individual living in Territory 2 (outside Winnipeg) and driving regularly into Territory 1 (Winnipeg) for work, school or some business purposes.

Each of these territories has distinctive rates which reflect differences in patterns of loss experience. This means motorists pay premiums which relate to the risk associated with insuring a vehicle in a particular geographic area of the province.

There are no proposed changes to the rating territories or their boundaries for 2019/20. The definitions of the rating territories are provided in *Part V(ii) VCS Vehicle Classification System Appendix 1*.

VCS.3 INSURANCE USES

Motorists are required to insure their vehicles in various insurance use categories. These categories take into consideration the varying degrees of risk associated with the different purposes for which these vehicles are used. Insurance uses with high claims costs will be rated higher than uses experiencing lower claims costs.

There are no proposed changes to insurance uses for 2019/20. However, with the introduction of Vehicle for Hire insurance uses effective March 1, 2018, the Corporation expired the Limousine All Uses, Taxi/Livery Passenger Vehicle, and Wheelchair Livery Bus uses as of May 1, 2018. Additional information on Vehicle-for-Hire can be found in *Part V(ii) Vehicles for Hire*.

Insurance use definitions are located in *Part V(ii) VCS Vehicle Classification Systems Appendix 2* and insurance uses by major class are located in *Part V(ii) VCS Vehicle Classification Systems Appendix 3*.

VCS.4 VEHICLE RATING FACTORS

VCS.4.1 Rate Groups

The rate groups into which vehicles are assigned reflect factors such as: vehicle make, model, model year, gross vehicle weight, engine size, declared value and Canadian Loss Experience Automobile Rating (CLEAR). These factors have a bearing on the cost of claims for particular types of vehicles. In general, vehicles in higher rate groups pay higher rates than vehicles in lower rate groups, to reflect the higher expected claims costs.

VCS.4.1.1 Passenger Vehicles and Light Rated Trucks

The CLEAR system is used for the assignment of rate groups to passenger vehicles (cars, passenger vans and sport utility vehicles) and light trucks. The CLEAR system, produced by the Insurance Bureau of Canada (IBC), uses actual loss experience data from across Canada to determine relative loss cost indices for specific vehicle descriptions (make, model and model year). These indices take into account the varying costs of collision, comprehensive, and injury claims associated with these vehicle descriptions. The expected claims costs for each vehicle description are used to establish CLEAR rate groups. CLEAR rate groups are one of the vehicle rating factors used to establish premiums for passenger vehicles and light trucks.

The CLEAR system provides incentives, in the form of lower premiums, to consumers who purchase safer, less damage-prone or more theft resistant vehicles. Increased consumer demand for vehicles with new safety features, such as electronic stability control and accident avoidance systems, should encourage manufacturers to include these safety features. The CLEAR system is thus a loss prevention initiative, as well as a method of achieving equity in the vehicle rating system.

IBC annually updates CLEAR rate groups to account for changes in claims costs for vehicles. Generally three factors cause the CLEAR recommendations to be adjusted:

- Actual experience for new vehicles is developed
- Loss costs change as vehicles age
- New trends emerge such as higher theft rates for a particular make and model.

CLEAR provides separate rate group recommendations for collision, comprehensive and injury coverages. Since the Basic Autopac product combines these coverages, the CLEAR recommendations must be combined to obtain the MPI rate group applicable in Manitoba.

For collision and comprehensive coverages, the CLEAR recommendations range from rate groups 1 to 99. These CLEAR recommendations are weighted together to obtain the MPI collision and comprehensive combined rate group.

The Corporation's weighting allocation in 2018/19 assigned 83% to the CLEAR collision recommendation and 17% to the CLEAR comprehensive recommendation based on the ratio of collision to comprehensive claims costs in Manitoba. For 2019/20, upon reevaluation, the weighting allocation remains at 83% to collision and 17% to comprehensive.

For injury coverage, starting in the 2015/16 insurance year, IBC began providing two separate recommendations, one for Ontario and one for Alberta/Atlantic provinces. The Ontario table uses injury rate groups ranging from 0 to 50, while the Alberta/Atlantic provinces table uses injury rate groups ranging from 1 to 15.

As Manitoba injury relativities between rate groups are relatively flat (i.e. the relativities do not vary significantly across rate groups), the Corporation decided to use the recommendation for Alberta/Atlantic provinces due to the smaller injury rate group range. Further, the Corporation converted the IBC's 1 to 15 range into a 1 to 5 range for Manitoba.

The matrix below compares IBC's injury rate groups for Alberta/Atlantic provinces with the Corporation's injury rate groups for the 2015/16 to 2019/20 insurance years.

Figure VCS-1: Injury Rate Group Table

Line No.	2015 IBC Rate Group	2015 MPI Rate Group	2016 IBC Rate Group	2016 MPI Rate Group	2017 IBC Rate Group	2017 MPI Rate Group	2018 & 2019 IBC Rate Group	2018 & 2019 MPI Rate Group
1	7	1	6 & 7	1	6 & 7	1	1 - 6	1
2	8	2	8	2	8	2	7	2
3	9	3	9	3	9	3	8 - 9	3
4	10	4	10	4	10	4	10	4
5	11	5	11 & 12	5	11 & 12	5	11- 15	5

6 Note: The most recent IBC Injury Rating goes from rate groups 1 to 15

The MPI injury rate group is then added to the MPI collision and comprehensive combined rate group to obtain the final MPI rate group applicable in Manitoba.

Rate group adjustments were then applied to passenger vehicles and light trucks to update the existing 2018/19 MPI rate groups to the revised 2019/20 MPI rate groups. These adjustments were applied as follows:

- If the 2018/19 rate group is higher than the 2019/20 rate group, the 2018/19 rate group is adjusted down to the 2019/20 rate group.
- If the 2018/19 rate group is lower than the 2019/20 rate group, the 2018/19 rate group is adjusted up to the 2019/20 rate group, up to a maximum of one rate group.

For 2019/20, the Corporation has 41 rate groups (rate groups 0 to 40). New vehicle descriptions are assigned MPI rate groups as they enter the local market. These rate groups are based on CLEAR recommendations as they become available.

Rate groups assigned to passenger vehicles for 2019/20 are contained in *Part V(ii) VRG Vehicle Rate Groups Part 1A* & *Part V(ii) VRG Vehicle Rate Groups Part 1C*. The change in rate group from 2018/19 is contained in *Part V(ii) VRG Vehicle Rate Groups Part 1B* & *Part V(ii) VRG Vehicle Rate Groups Part 1D*.

The rate groups assigned to light trucks for 2019/20 are contained in *Part V(ii) VRG Vehicle Rate Groups Part 2A* & *Part V(ii) VRG Vehicle Rate Groups Part*

2C. The change in rate group from 2018/19 is contained in *Part V(ii) VRG Vehicle Rate Groups Part 2B* & *Part V(ii) VRG Vehicle Rate Groups Part 2D*.

The 'Heavy Trucks Rated as Light Trucks' Rate Group Table, contained in *Part V(ii) VRG Vehicle Rate Groups Part 03*, is used to rate farm and fishing trucks with a gross vehicle weight (GVW) in excess of 4,540 kg and with a body style of chassis mounted camper, crew cab, crew cab service truck, extended cab, extended cab service truck, light delivery, light pickup, panel van, service truck or sport utility vehicle. The rate groups in this table are determined by utilizing the current heavy-rated-as-light truck population from the rate model. The most current CLEAR rated recommendations are applied to this population of vehicles and then averaged for each model year. This establishes a rate group table based on a realistic representation of the annual mix of vehicles in the heavy-rated-as-light truck population.

VCS.4.1.2 Heavy Trucks

Heavy trucks are trucks with a GVW of more than 4,540 kg (with the exception of heavy-rated-as-light trucks).

There are three broad classes of heavy trucks that have different physical damage coverage:

- Trucks (excluding farm and fishing trucks) weighing between 4,541 kg and 16,330 kg GVW, which carry physical damage coverage.
- Trucks (excluding farm and fishing trucks) weighing more than 16,330 kg GVW, which do not carry physical damage coverage.
- Farm and fishing trucks with body styles *other than* chassis mounted camper, crew cab, crew cab service truck, extended cab, extended cab service truck, light delivery, light pickup, panel van, service truck or sport utility vehicle, which carry physical damage coverage.

As in previous years, heavy truck rate groups are adjusted down one rate group per model year. This allows for the newest model year vehicles to be assigned the highest rate group while vintaging the remaining model year vehicles.

The structures of the Heavy Truck Rate Group Table for 2019/20 and 2018/19 are as follows:

Figure VCS- 2: Heavy Truck Rate Group Table

Line No.	Model Year	2019/20	2018/19

10	**2011**	8	9
11	**2010**	7	8
12	**2009**	6	7
13	**2008**	5	6
14	**2007**	4	5
15	**2006**	3	4
16	**2005**	2	3
17	**2004**	1	2
18	**2003 and prior**	1	1

VCS.4.1.3 Buses

Buses are assigned rate groups based on owner declared values up to $50,000. There are no changes to the rate groups assigned to buses.

The rate groups assigned to buses are shown in *Part V(ii) VRG Vehicle Rate Groups Part 04*.

VCS.4.1.4 Motorcycles, Mopeds and Mobility Vehicles

Motorcycles, mopeds and mobility vehicles are assigned rate groups based on owner declared values up to $50,000. There are no changes to the rate groups assigned to motorcycles, mopeds and mobility vehicles.

The rate groups assigned to motorcycles, mopeds and mobility vehicles are shown in *Part V(ii) VRG Vehicle Rate Groups Part 04*.

VCS.4.1.5 Motorhomes

Motorhomes are assigned rate groups based on owner declared values, up to $50,000. There are no changes to the rate groups assigned to motorhomes.

The rate groups assigned to motorhomes are shown in *Part V(ii) VRG Vehicle Rate Groups Part 04*.

VCS.4.1.6 Trailers (excluding semi-trailers)

Trailers are divided into two categories: those with a declared value of $2,500 and lower, and those with declared values between $2,501 and $50,000. Trailers valued over $2,500 are assigned rate groups based on owner declared value. There are no changes to the rate groups assigned to trailers.

The rate groups assigned to trailers are shown in *Part V(ii) VRG Vehicle Rate Groups Part 04*.

VCS.4.2 Other Vehicle Rating Factors

In addition to rate groups, some vehicle types are also rated using additional vehicle rating factors. Trucks use gross vehicle weight ranges, buses use seating capacity

ranges, and motorcycles use engine displacement ranges as well as body styles. These additional vehicle rating factors account for differences in risk characteristics attributable to these factors.

There are no changes to these other vehicle rating factors for 2019/20.

Trucks are classified into three gross vehicle weight (GVW) categories:

- 4,540 kg or less
- 4,541 to 16,330 kg
- 16,331 kg or more

Buses are classified by seating capacity:

- 20 seats or less
- 21 to 35 seats
- 36 to 50 seats
- 51 seats or more

Motorcycles are classified into three engine size categories:

- 500 cc or less
- 501 to 1,000 cc
- 1,001 cc or more

Motorcycles are also classified based on their body styles. Motorcycles are grouped into five body style categories, for rating purposes, depending on their body style as determined by IBC. The sixteen IBC body styles are grouped into the five MPI body style rating categories as follows:

- Motorscooter Rating: includes Motorscooter and 3-Wheel Scooter body styles
- Other Rating: includes Cruiser, Dual Purpose, Motard, Enduro, Other and Standard body styles
- Sport Rating: includes Sport and Naked Sport body styles

- Sport Touring Rating: includes Sport Touring and Adventure body styles
- Touring Rating: includes Touring, Trike, 3-Wheel Motorcycle and Standard Sidecar body styles

The motorcycle body style definitions can be found in *Part V(ii) VCS Vehicle Classification Systems Appendix 4*.

IBC periodically makes changes to the body styles for existing models. The Corporation monitors these changes and, on an annual basis, updates body styles to match IBC's.

As established in 2007/08, motorcycles with a Sport Rating, 1994 and older, and with a horsepower to weight ratio of 0.355 or lower will continue to be reclassified as Other Rating.

VCS.5 DRIVING RECORD

The driving record component of the classification plan is designed to adjust rates based on the driving convictions and claims history of the customer. Customers with a prior history of claims, or poor driving records, are a higher risk and consequently pay higher rates.

The driving record portion of the vehicle classification plan has two components:

- Vehicle Premium Discount
- Fleet Safety Program

VCS.5.1 Vehicle Premium Discount

The Corporation implemented the Driver Safety Rating (DSR) program, as prescribed in legislation, on March 1, 2010. The DSR Scale ranges from a high of 15 merits to a low of 20 demerits. Registered owners with merits receive a vehicle premium discount when they insure their vehicles. In order to receive a vehicle premium discount, the vehicle must be insured in one of the following use categories:

- Accessible Vehicle-for-Hire - (all time bands)
- All Purpose Mobility Vehicle
- All Purpose Moped
- All Purpose Motorcycle - (all body style rating categories)
- All Purpose Motorhome
- All Purpose Passenger Vehicle
- All Purpose Truck
- Artisan Truck (GVW less than 16,331 kg)
- Collector Passenger Vehicle
- Collector Truck
- Common Carrier Local Passenger Vehicle
- Common Carrier Passenger Vehicle within 161 km in Manitoba
- Common Carrier Truck within 161 km in Manitoba

- Common Carrier Truck within city or municipality
- Farm or Fishing All Purpose Truck (GVW less than 4,541 kg or a body style of chassis mounted camper, crew cab, crew cab service truck, extended cab, extended cab service truck, light delivery, light pickup, panel van, service truck or sport utility vehicle)
- Farm Passenger Vehicle
- Limousine Vehicle-for-Hire - (all time bands)
- Passenger Vehicle-for-Hire (Passenger Vehicle) - (all time bands)
- Passenger Vehicle-for-Hire (Truck 4,499 kg or less GVW) - (all time bands)
- Pleasure Moped
- Pleasure Motorcycle - (all body style rating categories)
- Pleasure Motorhome
- Pleasure Passenger Vehicle
- Pleasure Truck
- Taxicab Vehicle-for-Hire - (all time bands)

As initially applied for in the 2018 Interim Vehicles for Hire application, in this application MPI proposes that all Vehicles for Hire, including taxicabs not previously eligible, will now be eligible for vehicle premium discounts.

Further information on the DSR program and the vehicle premium discount scale can be found in *Part V(ii) DSR Driver Safety Rating*.

VCS.5.2 Fleet Rebates and Surcharges

The Corporation's fleet rebate/surcharge program applies where an owner has 10 or more vehicles registered on the first day of any customer month, and the number of days the fleet vehicles are insured meets or exceeds the minimum number of days. All vehicles can be included in a fleet except:

- Insurance exempt vehicles
- Vehicle-for-Hire - (all time bands)
- Motorcycles, Mopeds, and Mobility Vehicles

- Trailers
- Vehicles with PIPP coverage only
- Off-road vehicles
- Vehicles under a Lay-up policy or a Rental Car Insurance policy

Fleet rebates and surcharges are determined by the loss ratio of the fleet. Loss ratio is the ratio between all losses paid by MPI, and the fleet premiums paid to MPI. Except for comprehensive claims, which are fully included in the calculation of the loss ratio, claims are included according to the degree of responsibility. For example, if the fleet vehicle is held 40 percent responsible for a claim, only 40 percent of the cost of the claim (including all costs for which the fleet driver is responsible) is assessed to the fleet. The maximum amount used for any one loss is $25,000.

Fleet assessments may be adjusted based on increases or decreases to claims amounts, which were not included in the previous year's fleet assessment.

Fleet rebates and surcharges vary, depending on the loss ratio. The current fleet rebate scale ranges from a 1 percent rebate (69 percent loss ratio) to a maximum 33 percent rebate (37 percent or lower loss ratio), and the fleet surcharge scale ranges from a 1 percent surcharge (80 percent loss ratio) to a maximum 50 percent surcharge (129 percent or more loss ratio).

For 2019/2020, there are no changes proposed to the existing fleet rebate or surcharge scales. The rebate and surcharge scales can be found in *Part V(ii) RM Ratemaking Appendix 9 Table 7*.

Appendix 1: VEHICLE CLASSIFICATION SYSTEM TERRITORIES

Territory 1

Territory 1 includes the City of Winnipeg, including the following areas and municipalities: East Kildonan, West Kildonan, St. Boniface, St. James-Assiniboia, Transcona, St. Vital, Headingley, Tuxedo, Charleswood, North Kildonan, Old Kildonan, Fort Garry, St. Norbert, East St. Paul, West St. Paul.

Territory 2

Territory 2 includes the cities of Brandon, Portage la Prairie, and the remainder of Manitoba south of the 53rd parallel that is, not included in Territory 1, including the following municipalities which border Territory 1: Springfield, Rockwood, Cartier, Tache, Rosser, Macdonald, St. Clements, Ritchot, St. Andrews, St. Francois Xavier.

Territory 3

Territory 3 includes all of Manitoba north of the 55th parallel; e.g., Thompson, Lynn Lake, Churchill, Gillam.

Territory 4

Territory 4 is the area of Manitoba between the 53rd and 55th parallels; e.g., The Pas, Flin Flon, Grand Rapids, Oxford House.

Commuter (Territory 5)

The Commuter group is applied to a vehicle where the registered owner's permanent address is in Territory 2, and the vehicle is used to drive to work or school, or part way to work or school, in Territory 1. The vehicle is used for this purpose more than four days a month. A commuter rate is charged, provided the vehicle is insured for any of the following insurance uses:

- All Purpose Motorcycle
  - Motorscooter Rating
  - Other Rating
  - Sport Rating
  - Touring Rating
  - Sport Touring Rating
- All Purpose Motorhome
- All Purpose Passenger Vehicle
- All Purpose Truck
- Artisan Truck (up to 16,330 kg)
- Farming All Purpose Truck (up to 4,540 kg GVW) *
- Fishing All Purpose Truck (up to 4,540 kg GVW) *
- Other Truck (up to 16,330 kg)
- Passenger Vehicle-for-Hire (Passenger Vehicle)
- Passenger Vehicle-for-Hire (Truck 4,499 kg or less GVW)

* 4,540 kg GVW or less; or a body style of chassis mounted camper, crew cab, crew cab service truck, extended cab, extended cab service truck, light delivery, light pickup, panel van, sport utility or service truck, regardless of weight.

Appendix 2: VEHICLE CLASSIFICATION SYSTEM INSURANCE USE DEFINITIONS BY NAME

Insurance Use	Description
Accessible Vehicle-for-Hire	A vehicle for hire that is a passenger vehicle which is equipped with a wheelchair ramp or lift and operated for the transportation of persons who use a wheelchair or mobility aid, motorized or otherwise, and their escorts, but does not include vehicles owned or operated by or on behalf of a municipality to provide public transportation services.
All Purpose Mobility Vehicle	A mobility vehicle manufactured or modified for operation by a physically disabled person with a speed capability between 15 and 50 km/hour. Eligible for vehicle premium discount.
All Purpose Moped	A moped as defined in *The Highway Traffic Act* (an engine displacement of 50 cc or less or an electric motor, neither of which is capable of attaining a speed greater than 50 km/hour) that is used for driving to or from or part way to or from work or school, or is used in connection with a business, trade, or occupation. Eligible for vehicle premium discount.
All Purpose Motorcycle (Refer to the motorcycle body style definitions in Attachment 4)	A motorcycle as defined in *The Highway Traffic Act* (capable of attaining a speed of 50 km/hour or more) that is used for driving to or from or part way to or from work or school, or is used in connection with a business, trade, or occupation. Eligible for vehicle premium discount.

Insurance Use	Description
All Purpose Motorhome	A motorhome as defined in *The Highway Traffic Act* used for driving to or from or part way to or from work or school, or used in connection with a business, trade, or occupation. Eligible for vehicle premium discount.
All Purpose Passenger Vehicle	A private passenger vehicle used for driving to or from or part way to or from work or school, or used in connection with a business, trade, or occupation (Excludes Common Carrier Local Passenger Vehicle). Eligible for vehicle premium discount.
All Purpose Snow Vehicle	A snow vehicle (not a snowmobile) operated under the Highway Traffic Act.
All Purpose Trailer $2,500 or less	A trailer with a declared value of not more than $2,500. All uses allowed.
All Purpose Trailer $2,501 or more	A trailer with a declared value of more than $2,500. All uses allowed.
All Purpose Truck	A truck with a gross vehicle weight (GVW) of not more than 4,540 kg that (a) is driven to or from or part way to or from school or work; or (b) is used as an artisan truck (tradesperson, gardener, greenhouse operator, horticulturist) or as an Other Truck (no other specified insurance use) and has a body style of chassis mounted camper, crew cab, crew cab service truck, extended cab, extended cab service truck, light delivery, light pickup, panel van, service truck, or sport utility; or (c) is used for business purposes other than specified in (b) above for no more than 1,609 km during a rating term. Eligible for vehicle premium discount.

Insurance Use	Description
Antique Vehicle	A vehicle not less than 30 years old. Can only be driven when taking it to be repaired or serviced; or taking it to or from or displaying it in a parade, procession, or rally authorized by the Registrar.
Artisan Truck	A truck with a GVW in excess of 4,540 kg or with a body style other than chassis mounted camper, crew cab, crew cab service truck, extended cab, extended cab service truck, light delivery, light pickup, panel van, service truck, or sport utility that is used by a tradesperson, gardener, greenhouse operator or horticulturist for carrying tools, materials, and equipment used in their trade. Eligible for vehicle premium discount if GVW less than 16,331 kg.
Cement/Brick/Exploration Truck	A truck with a GVW of 10,891 kg or more used to carry cement, building blocks, bricks, or drilling/exploration/seismographic equipment.
Charter Bus – Local	A bus hired by a group on a flat fee basis for their collective transportation to, from, or to and from any locality.
Collector Passenger Vehicle	A private passenger vehicle that has a value of at least $5,000, is a model year at least 25 years less the current model year for private passenger vehicles, and (a) is not driven to or from or part way to or from work or school more than four days in one month or more than 1,609 km during a rating term; and (b) is not used for a business,trade or occupation. Eligible for vehicle premium discount.

Insurance Use	Description
Collector Truck	A truck with a GVW of 4,540 kg or less that has a value of at least $5,000, is a model year at least 25 years less the current model year for trucks, and (a) is not driven to or from or part way to or from work or school more than four days in one month or more than 1,609 km during a rating term; and (b) is not used for a business, trade or occupation. Eligible for vehicle premium discount.
Common Carrier Bus – Over 161 km outside MB	A bus used for regular schedules and charters extra-provincially. Personal Injury Protection Plan only with coverage subject to non-residency restrictions.
Common Carrier Bus - Within MB	A bus used for regular schedules and charters within Manitoba.
Common Carrier Local Passenger Vehicle	A passenger vehicle used more than four days in one month or more than 1,609 km during a rating term by a courier or common carrier within a city or municipality, or for any other delivery purpose in connection with a business, trade or occupation, but does not include a public service vehicle. Eligible for vehicle discount.
Common Carrier Passenger Vehicle - Over 161 km in MB	A passenger vehicle registered as a public service vehicle used to carry the goods of others, over 161 km in Manitoba only.
Common Carrier Passenger Vehicle - Within 161 km in MB	A passenger vehicle registered as a public service vehicle used to carry the goods of others, within 161 km in Manitoba only. Eligible for vehicle premium discount.

Insurance Use	Description
Common Carrier Truck (Local – Within City or Municipality)	A truck used to carry the goods of more than one contractee within city or municipal limits. Eligible for vehicle premium discount.
Common Carrier Truck - Over 161 km in MB	A truck registered as a public service vehicle used to carry the goods of others, over 161 km in Manitoba only.
Common Carrier Truck - Within 161 km in MB	A truck registered as a public service vehicle used to carry the goods of others, within 161 km in Manitoba only. Eligible for vehicle premium discount.
Common/Private/Contract Passenger Vehicle - Over 161 km outside MB	A passenger vehicle registered as a public service vehicle operating extra-provincially in excess of 161 km of the Manitoba border. Personal Injury Protection Plan only with coverage subject to non-residency restrictions.
Common/Private/Contract Truck - Over 161 km outside MB	A truck registered as a public service vehicle operating extra-provincially in excess of 161 km of the Manitoba border. Personal Injury Protection Plan only with coverage subject to non-residency restrictions.
Dealer All Uses Except Motorcycles	A passenger vehicle, truck, motorhome or bus owned or in the possession of a Dealer. Includes mopeds, mobility vehicles and trailers but excludes motorcycles.
Dealer Moped	A moped or mobility vehicle owned or in the possession of a Dealer. Excludes motorcycles.
Dealer Motorcycle	A motorcycle owned or in the possession of a Dealer.

Insurance Use	Description
Dealer Trailer	A trailer owned or in the possession of a Dealer.
Disabled Persons/Private/ Business Bus	A bus (passenger vans used to carry disabled persons are considered buses regardless of seating capacity) that is (a) used for the transportation of disabled persons, except those required to operate under the jurisdiction of the Taxicab Board; or (b) a private bus or one used in connection with a business, trade or occupation without direct compensation; except Charter Bus, Common Carrier Bus, Transit Bus, School Bus or U-Drive Bus.
Driveaway Over 161 km outside Manitoba	A vehicle operated as a Driveaway extra-provincially in excess of 161 km of the Manitoba border. Personal Injury Protection Plan only with coverage subject to non-residency restrictions.
Driveaway Within Manitoba	A vehicle operated as a Driveaway within Manitoba.
Farm Passenger Vehicle	A private passenger vehicle that (a) is used by a person who lives on a farm; and (b) is used by a person engaged in farming operations for not less than 720 hours cumulative in each rating term or is retired from farming; and (c) is not driven to or from or part way to or from work or school more than four days in one month or more than 1,609 km during a rating term; and (d) is not used for a business, trade or occupation other than farming for more than four days in one month or more than 1,609 km during a rating term. Eligible for vehicle premium discount.

Insurance Use	Description
Farming All Purpose Truck	A truck registered to a farmer as defined in *The Highway Traffic Act* and used for farming operations. Eligible for vehicle premium discount if GVW is less than 4,541 kg or if a body style of chassis mounted camper, crew cab, crew cab service truck, extended cab, extended cab service truck, light delivery, light pickup, panel van, service truck or sport utility, regardless of weight.
Fishing All Purpose Truck	A truck used primarily for the purpose of commercial fishing. Eligible for vehicle premium discount if GVW is less than 4,541 kg or if a body style of chassis mounted camper, crew cab, crew cab service truck, extended cab, extended cab service truck, light delivery, light pickup, panel van, service truck or sport utility, regardless of weight.
Funeral Passenger Vehicle	A passenger vehicle or hearse with operations restricted to funeral use.
Limousine Vehicle-for-Hire	A vehicle for hire that is a passenger vehicle having an extended wheelbase or is designed by the manufacturer as a luxury or specialized passenger vehicle and is operated for hire by a limousine or private car service, including sightseeing tours, but is not equipped with a taximeter.
Logging Truck	A truck used to transport logs, pulpwood, shavings, rough lumber and ties.
Off-Road Vehicle All Purpose All Terrain Vehicle	An off-road all terrain vehicle. All uses allowed. Third party liability and underinsured motorist coverage only.

Insurance Use	Description
Off-Road Vehicle All Purpose Motorcycle	An off-road motorcycle. All uses allowed. Third party liability and underinsured motorist coverage only.
Off-Road Vehicle All Purpose Snow Vehicle	An off-road snow vehicle. All uses allowed. Third party liability and underinsured motorist coverage only.
Off-Road Vehicle All Purpose Snowmobile	An off-road snowmobile. All uses allowed. Third party liability and underinsured motorist coverage only.
Other Truck	A truck used for a business for which there is no other specified insurance use and (a) has a GVW of 4,540 kg or less and is **not** one of the following body styles: chassis mounted camper, crew cab, crew cab service truck, extended cab, extended cab service truck, light delivery, light pickup, panel van, service truck or sport utility; or (b) has a GVW of 4,541 kg or more. Or a non-business truck with a GVW of 4,541 kg or more.
Passenger Vehicle-for-Hire (Passenger Vehicle)	A vehicle for hire that is a passenger vehicle and is not an accessible vehicle-for-hire, a limousine vehicle-for-hire or a taxicab vehicle-for-hire or a vehicle owned or operated by or on behalf of a municipality to provide public transportation services.
Passenger Vehicle-for-Hire (Truck with 4,499 kg or less GVW)	A vehicle-for-hire that is a truck with gross vehicle weight of 4,499 kg or less and a body style as described in Schedule AA of the Manitoba Public Insurance Corporation Act.

Insurance Use	Description
Petroleum/Chemical Truck	A truck used to transport gasoline, oil, propane or other petroleum or chemical products or used to transport explosives or radioactive material.
Pleasure Moped	A moped as defined in *The Highway Traffic Act* (an engine displacement of 50 cc or less or an electric motor neither of which is capable of attaining a speed greater than 50 km/hour) that (a) is not driven to or from or part way to or from work or school more than four days in one month or more than 1,609 km during a rating term; and (b) is not used in connection with a business, trade or occupation. Eligible for vehicle discount.
Pleasure Motorcycle (Refer to the motorcycle body style definitions in Attachment 4)	A motorcycle as defined in *The Highway Traffic Act* (capable of attaining a speed of 50 km/hour or more) that (a) is not driven to or from or part way to or from work or school more than four days in one month or more than 1,609 km during a rating term; and (b) is not used in connection with a business, trade or occupation. Eligible for vehicle premium discount.
Pleasure Motorhome	A motorhome as defined under *The Highway Traffic Act* that (a) is not driven to or from or part way to or from work or school, more than four days in one month or more than 1,609 km during a rating term; and (b) is not used for a business, trade or occupation. Eligible for vehicle premium discount.

Insurance Use	Description
Pleasure Passenger Vehicle	A private passenger vehicle that (a) is not driven to or from or part way to or from work or school more than four days in one month or more than 1,609 km during a rating term; and (b) is not used for a business, trade or occupation. Eligible for vehicle premium discount.
Pleasure Truck	A truck with a GVW of 4,540 kg or less that (a) is not driven to or from or part way to or from work or school more than four days in one month or more than 1,609 km during a rating term; and (b) is not used for a business, trade or occupation. Eligible for vehicle premium discount.
Police/Emergency Passenger Vehicle (includes Ambulance)	A passenger vehicle used by a police force, fire department or ambulance service or used as an authorized emergency vehicle as defined under *The Highway Traffic Act*.
Police/Emergency Truck	A truck used by a police force, fire department or ambulance service or used as an authorized emergency vehicle as defined under *The Highway Traffic Act*.
Repairer	A vehicle in the custody of a repairer for the purpose of testing or servicing.
Sand/Gravel Truck	A truck with a GVW of 10,891 or more used to transport sand, gravel, stone, asphalt or reduced minerals.
School Bus	A bus used by a school, hospital, institution or non-profit organization.
Taxicab Vehicle-for-Hire	A vehicle-for-hire that is a passenger vehicle equipped with a taximeter.

Insurance Use	Description
Tow Truck	A vehicle with body style tow, excluding such vehicles used extra-provincially.
Transit Bus	A public transit bus.
U-Drive Bus	A bus leased for 30 days or less or operated as a U-Drive.
U-Drive Moped	A moped leased for 30 days or less or operated as a U-Drive.
U-Drive Motorhome	A motorhome leased for 30 days or less or operated as a U-Drive.
U-Drive Passenger Vehicle	A passenger vehicle leased for 30 days or less or operated as a U-Drive. Includes a courtesy vehicle supplied by a body shop or garage for a rental fee.
U-Drive Truck	A truck leased for 30 days or less or operated as a U-Drive. Includes a courtesy truck supplied by a body shop or garage for a rental fee.

Appendix 3: VEHICLE CLASSIFICATION SYSTEM MAJOR INSURANCE CLASSES

MAJOR CLASS: PRIVATE PASSENGER VEHICLES

- All Purpose Motorhome
- All Purpose Passenger Vehicle
- All Purpose Truck
- Antique Vehicle
- Collector Passenger Vehicle
- Collector Truck
- Disabled Persons/Private/Business Bus
- Farm Passenger Vehicle
- Farming All Purpose Truck - 4,540 kg or less
- Fishing All Purpose Truck - 4,540 kg or less
- Passenger Vehicle-for-Hire (Passenger Vehicle)
- Passenger Vehicle-for-Hire (Truck 4,499 kg or less GVW)
- Pleasure Motorhome
- Pleasure Passenger Vehicle
- Pleasure Truck

MAJOR CLASS: COMMERCIAL VEHICLES

- All Purpose Snow Vehicle
- Artisan Truck
- Cement/Brick/Exploration Truck
- Common/Private/Contract Passenger Vehicle - Over 161 km outside Manitoba
- Common/Private/Contract Truck - Over 161 km outside Manitoba
- Common Carrier Local Passenger Vehicle

MAJOR CLASS: COMMERCIAL VEHICLES (*cont'd)*

- Common Carrier Passenger Vehicle - Within 161 km in Manitoba
- Common Carrier Passenger Vehicle - Over 161 km in Manitoba
- Common Carrier Truck (Local – Within city or municipality)
- Common Carrier Truck - Over 161 km in Manitoba
- Common Carrier Truck - Within 161 km in Manitoba
- Dealer All Uses - Except Motorcycle
- Dealer Moped
- Dealer Motorcycle
- Dealer Trailer
- Driveaway - Over 161 km outside Manitoba
- Driveaway - Within Manitoba
- Farming All Purpose Truck Over 4,540 kg
- Fishing All Purpose Truck Over 4,540 kg
- Logging Truck
- Other Truck
- Petroleum/Chemical Truck
- Repairer All Uses
- Sand/Gravel Truck
- Tow Truck

MAJOR CLASS: PUBLIC VEHICLES

- Accessible Vehicle-for-Hire
- Charter Bus – Local
- Common Carrier Bus Over 161 km outside Manitoba
- Common Carrier Bus Within Manitoba
- Funeral Passenger Vehicle
- Limousine Vehicle-for-Hire

MAJOR CLASS: PUBLIC VEHICLES *(cont'd)*

- Police/Emergency Passenger Vehicle (includes Ambulance)
- Police/Emergency Truck
- School Bus
- Taxi Vehicle-for-Hire
- Transit Bus
- U-Drive Bus
- U-Drive Moped
- U-Drive Motorhome
- U-Drive Passenger Vehicle
- U-Drive Truck

MAJOR CLASS: MOTORCYCLES

- All Purpose Mobility Vehicle
- All Purpose Moped
- All Purpose Motorcycle
  - Motorscooter Rating
  - Other Rating
  - Sport Rating
  - Sport Touring Rating
  - Touring Rating
- Pleasure Moped
- Pleasure Motorcycle
  - Motorscooter Rating
  - Other Rating
  - Sport Rating
  - Sport Touring Rating
  - Touring Rating

MAJOR CLASS: TRAILERS

- All Purpose Trailer – Value up to $2,500
- All Purpose Trailer – Value $2,501 – $50,000

MAJOR CLASS: OFF-ROAD VEHICLES

- Off-Road Vehicle – All-Terrain Vehicle
- Off-Road Vehicle – Motorcycle
- Off-Road Vehicle – Snow Vehicle
- Off-Road Vehicle – Snowmobile

Appendix 4: MOTORCYCLE BODY STYLE DEFINITIONS

Body Style Rating Category	Body Style	Description of Body Style
Touring Rating	Touring	A motorcycle that is designed and marketed for long distance travel that includes such things as a large engine, high amounts of storage, including top trunks and saddlebags, reverse gears, onboard air compressors, large fairings and windshields and includes amenities like cruise control, stereo audio entertainment systems, citizen band communication systems, and heated seats and grips.
	Trike	A motorcycle that is similar to a touring motorcycle but that is equipped with two wheels at the back and one at the front. The usual layout of a trike is for the power to be delivered to one or both rear wheels, while the front is used for steering.
	3-Wheel Motorcycle	A motorcycle that is designed with a "Y" shaped chassis featuring two wheels at the front and one at the rear.
	Standard Sidecar	A motorcycle that has attached to it a one wheeled sidecar.
Sport Rating	Sport	A fast, light, sleek motorcycle that is designed for maximum performance and maneuverability. It is distinguishable from other motorcycles by its full fairing and the rider's tipped-forward seating position.

Body Style Rating Category	Body Style	Description of Body Style
Sport Rating *(cont'd)*	Naked Sport	A motorcycle with a design that is reduced to its basic form and stripped down to its fundamental parts. The front wheel is visible from the rider's position and the emphasis of the design is on functionality, performance and ergonomics, rather than on body panels and exaggerated riding positions that are emphasized for sport bikes. These motorcycles may also be marketed as "naked" or "street" bikes.
Sport Touring Rating	Sport Touring	A motorcycle that is designed and marketed as a hybrid between a sport and a touring motorcycle, that allows long-distance riding with more emphasis on sport-like performance in both handling and speed than a touring motorcycle.
	Adventure	A motorcycle that is designed and marketed as a combination sport, touring and off-road motorcycle. This body style is designed with the features of a on-road motorcycle capable of cruising on paved roads but also includes big tires, large fuel tanks and comfortable seats as well as high ground clearance in order that rough terrain may be traversed without difficulty.
Motorscooter Rating	Motorscooter	A motorscooter is a motorcycle with a step-through frame that generally has smaller wheels than those of a standard motorcycle. A person can ride a scooter without straddling any part of it.
	3-Wheel Scooter	A scooter that is designed to include a second independent front wheel that is used to increase ride stability.

Body Style Rating Category	Body Style	Description of Body Style
Other Rating	Cruiser	A motorcycle that is designed with a low seat height, wider rear tire, raked front forks, and forward controls with the foot pegs way out in front as opposed to being straight down. The design emphasizes comfort and appearance with a relaxed upright seating position, and often includes an abundance of chrome.
	Dual Purpose	A motorcycle for both highway and off-road use, its design includes fenders and tires suitable for some off-road uses coupled with street safety requirements such as mirrors and turn signal indicators. An off-road motorcycle that has been modified to meet the requirements to be registered under *The Highway Traffic Act* is included in this body style.
	Motard	A motorcycle design that combines the design of a motocross and an enduro motorcycle, it is fitted with road racing tires while keeping the other features synonymous with off-road machines. These motorcycles are designed and marketed to compete over a race course that mixes road racing on tarmac with off-road sections.
	Enduro	A motocross motorcycle that may be registered under *The Highway Traffic Act* that features high ground clearance and copious suspension combined with minimal rider comforts. It is differentiated from a motocross motorcycle by the presence of silencers, flywheel weights and the features necessary for the on-road portion of enduro racing.

Body Style Rating Category	Body Style	Description of Body Style
Other Rating ***(cont'd)***	Other	A motorcycle that can be registered under *The Highway Traffic Act* and does not have a body style that is included in the rating categories of Touring, Sport, Sport Touring, Motorscooter, and Other.
	Standard	A motorcycle that is designed with a small rake and trail, and generally does not include accessories such as a windshield, saddlebags, trunk, or audio entertainment system.

VEHICLE RATE GROUP

As discussed in *Part V(ii) Vehicle Classification System VCS.4.1*, rate groups are assigned for the following vehicle types: passenger vehicles, trucks, buses, motorcycles, mopeds, mobility vehicles, motor homes, and trailers. The Vehicle Rate Group tables present the assigned rate groups by vehicle type, and the changes to the assigned rate groups for passenger vehicles and light trucks.

For the 2019 GRA, the Vehicle Rate Group Tables have been provided in Excel format, as an attachment to the Application PDF. The Excel workbook can be accessed either through the Attachments pane in a PDF viewer, or by clicking *Part V(ii) VRG Vehicle Rate Group Tables*.

INVESTMENTS

INV.1 EXECUTIVE SUMMARY

With over $2.7 billion in investment assets, the Investment Income forecast is a major component of the financial condition of Manitoba Public Insurance (MPI or the Corporation). In fiscal 2017/18, investment income allocated to Basic was $116.3 million. This document provides an explanation of how the Basic line of business investment income is forecasted for the next five fiscal years from 2018/19 to 2022/23.

INV.1.1 Current Year Investment Themes - Summary

Asset Liability Management (ALM) Study Update

The ALM study was completed in late 2017. The benefits of implementing the outcomes of the ALM study are:

1. Separation of the commingled investment portfolio into five unique portfolios that back the corporation's liabilities and surplus. The five portfolios are Basic Claims, Basic Rate Stabilization Reserve (RSR), Pension, Extension and Special Risk Extension (SRE), and each will have unique asset allocations at the end of fiscal 2018/19. This will allow MPI to develop investment portfolios that better reflect the associated liabilities (where there are liabilities) and the investment goals of each portfolio.

2. De-risking the Basic Claims portfolio by eliminating exposure to growth assets. Interest rate risk associated with the Basic line of business is expected to be significantly reduced from the separating of investment assets into unique portfolios.

3. Optimizing the Basic Claims portfolio by increasing the exposure to corporate bonds and changing the allocation from government bonds to provincial bonds.

The Consumers' Association of Canada (CAC) provided 18 recommendations for MPI's Investment Portfolio presented in the 2017 General Rate Application (GRA) by Mr. Valter Viola. These 18 Recommendations have been addressed by Mercer in the ALM Phase 3 report. Further commentary by MPI on some of these recommendations have also been provided. The Corporation considers its responses to the CAC's 18 recommendations completed in full.

ALM Transition Plan

The transition from the consolidated portfolio into five unique portfolios is assumed to occur in the financial model at the end of Q4 2018/19, with the exception of funding private debt in 2019/20. The allocation to growth assets (equities, real estate, and infrastructure) will be reduced in order to fund the purchase of additional fixed income assets. The complete transition is expected to be completed by Q4 2019/20 as illiquid asset classes such as real estate and infrastructure must be partially sold and private debt must be purchased. The target weights for Basic Claims, RSR, and Employee Future Benefits are shown in the figure below.

Figure INV- 1: Asset Mix to be Implemented End of Q4 2018/19

Line No.	Target Weights	Basic Claims	RSR	Employee Future Benefits
1	**Fixed Income**			
2	**Provincial Bonds**	60.0%	20.0%	0.0%
3	**Corporate Bonds**	20.0%	10.0%	20.0%
4	**MUSH**	20.0%	5.0%	0.0%
	Private Debt	0.0%	15.0%	20.0%

6	**Public Equities**			
7	**Canadian Equities**	0.0%	12.0%	10.0%
8	**Global Equities**	0.0%	13.0%	18.0%
9	**Global Low Volatility**	0.0%	10.0%	7.0%
10	**Total Equities**	**0.0%**	**35.0%**	**35.0%**
11	**Alternatives**			
12	**Canadian Real Estate**	0.0%	10.0%	15.0%
13	**Infrastructure**	0.0%	5.0%	10.0%
14	**Total Alternatives**	**0.0%**	**15.0%**	**25.0%**

Basic net income is forecasted to increase by $95 million in 2018/19. This increase is primarily a result of the realization of Accumulated Other Comprehensive Income (AOCI) on equity assets. This is forecasted to occur with the separation of assets into unique portfolios at the end of 2018/19. Total equity is forecasted to be lower because investment asset returns are forecasted to be lower with fewer growth assets after ALM implementation.

The Minimum Capital Test (MCT) ratio will increase by 16% at the end of 2018/19 from 54% to 69% because of lower capital requirements on the Basic line of business investment assets. Interest income is forecasted to increase by approximately $18.5 million on average from 2019/20 to 2021/22 as there will be more fixed income assets in the portfolio supporting the Basic line of business. These projections are based on a Naive interest rate forecast.

The impact to the rate indication as a result of the ALM study is minimal. The break-even rate indication using the naive interest rate forecast and the assumed ALM implementation changes is 0.1%; with the capital maintenance provision included the

rate indication is 2.2%. Without the ALM changes, the break-even rate indication using the naive interest rate forecast is -0.1% and 1.9% with the capital maintenance provision (CMP).

Interest Rate Forecasting

MPI's Board of Directors (BoD) and Management have adopted a naive interest rate forecast. The naive forecast holds the Government of Canada (GoC) 10 year bond yield as of February 28, 2018 constant for the entire five year forecast. A naive interest rate forecast is superior to the 50/50 forecast because it has less standard error. The Naïve forecast is also endorsed by MPI's appointed actuary, Mr. Joe Cheng, who indicated that his firm reviews over 30 Dynamic Capital Adequacy Testing (DCAT) reports annually, and a naive forecast is the most common for the base scenario (see 2018 GRA PUB (MPI) 2-7 Attachment A). Mr. Cheng's October 2017 DCAT Peer Review Report (see *Part VI DCAT Attachment A*) also states:

> *In my opinion, a naïve interest rate assumption is appropriate for the base scenario. Notwithstanding the two recent rate hikes by the Bank of Canada, I do not see any material risk in assuming a naïve interest rate as a base case.*

INV.1.2 Investment Income Forecast - Summary

Ten asset classes are forecasted in the financial model. These asset classes include: cash, government bonds, corporate bonds, non-marketable bonds (MUSH), Canadian equities, U.S. equities/global equities, global low volatility, real estate (split into two components), infrastructure and private debt. The forecast also includes the impact of investment fees and pension expense. The accounting treatment, capital and income return, turnover, and funding assumptions are detailed in this document under each asset class. Finally, a comparison of this year's investment income forecast to the 2018 GRA forecast is provided.

- *Figure INV- 2* provides an investment income summary for the Basic Line of Business over a 10 year period, with 5 years of historical data, and 5 forecasted years. See INV.19 for the investment income summary and asset allocation for Basic Claims, RSR and Employee Future Benefits.
- *Figure INV- 3* provides the asset values and percentage of the total combined Basic Line of Business portfolio (Basic Claims and RSR) for each asset class over the same 10 year period.
- *Figure INV- 4* shows this year's naive interest rate forecast based on the GoC 10 year bond rate as of February 28, 2018, compared to last year's naive interest rate forecast used in the 2018 GRA.
- *Figure INV- 5* provides a summary of the major assumptions used in last year's application and this year's application, and the corresponding section in this document where the current assumptions are supported.

38	Funding	$6.5 M per quarter starting in Q1 2017/18 and ending in Q2 2018/19 (Total: $39 M)	No additional funding for infrastructure forecasted

INV.2 CURRENT YEAR INVESTMENT THEMES

This section summarizes the current year investment themes which include the ALM Study, ALM implementation timeline, and interest rate forecasting.

INV.2.1 ALM Study

Mercer was hired to assist with conducting an ALM Study through a Request For Proposal (RFP) process. Phase 1 and Phase 2 were completed by December 2017. Phase 3 was completed in January 2018. Here is a description of each Phase:

Phase One: Analyze merits of adopting unique asset allocation and Investment Policy Statement for Basic, Extension, SRE, RSR, and pension. Examine merits of adding exposure to various types of fixed income. Study the Corporation's interest rate risk management strategy (duration matching) relative to the alternatives (cash flow matching, bucketing/hybrid approach). Initial optimizations were also completed.

See *INV Appendix 12* for the Phase 1 report.

Phase Two: A discussion of new asset classes along with rationale for inclusion and exclusion, proposed asset allocations for each portfolio including estimates of risk and return, and implementation considerations were addressed in Phase Two.

See *INV Appendix 13* for the Phase 2 report.

Phase Three: Finalize responses to CAC's 18 recommendations, which are discussed in *INV.2.1.2 Commentary from Mercer* and MPI on the CAC's 18 Recommendation.

See *INV Appendix 14* for the Phase 3 report.

INV.2.1.1 ALM Study Outcomes

The Corporation currently has a single commingled investment portfolio that backs all Corporate liabilities and surplus, which includes liabilities from:

1. Basic claims
2. Extension
3. SRE
4. RSR
5. Employee Future Benefits (EFB), which is primarily pension

As a result of the recently completed ALM study, MPI will develop five unique investment portfolios backing the liabilities listed above, each with unique asset allocations at the end of fiscal 2018/19. This will allow the Corporation to develop investment portfolios that better reflect the associated liabilities (where there are liabilities) and the investment goals of each portfolio.

Segmenting the portfolios by line of business will provide a better understanding of changes in the value of the liabilities and the associated assets. This will enable MPI to optimize each investment portfolio to best match the associated liability.

The portfolio backing the Basic claims will consist of 100% fixed income, the portfolios backing Extension, SRE and RSR will be balanced (50% growth assets/50% fixed income assets), and the portfolio backing EFB will have a slightly higher allocation to growth assets at 60%. Currently, the portfolios recommended for RSR, Extension and SRE have the same asset allocations (50/50 growth/fixed income), but because the portfolios are unique (i.e. no assets shared between them) the asset allocations can be changed in the future if necessary.

Summary of ALM Outcomes

- Separation of commingled portfolio into unique portfolios in order to better reflect the underlying liabilities and investment goals of the portfolio.
- De-risking the basic claims liabilities portfolio by reducing interest rate risk and eliminating exposure to growth assets.
- Higher marketable bond yield due to more corporate bonds.

INV.2.1.2 Commentary from Mercer and MPI on the CAC's 18 Recommendations

Mercer's responses to the CAC's 18 recommendations are summarized in the response below. MPI's response is provided where appropriate. For a full discussion from Mercer, see the Phase 3 Report (*INV Appendix 14*). CAC's recommendation #15 on duration matching is discussed in the next section.

CAC Recommendation #1, #2 and #3

1. Clarity of Accounting Choices

2. Adoption of More Comparable Accounting Principles

3. Available For Sale (AFS) and Held to Maturity (HTM) Accounting

Mercer's Response: "From Mercer's perspective, each of these items are accounting specific decisions which should be decided in consultation with its auditors."

MPI's Response: Key consideration compliance with International Financial Reporting Standards (IFRS) accounting principles. Policies should be chosen that align with the nature of the assets and liabilities.

CAC Recommendation #4: Re-measurement of Employee Benefits

Mercer's Response: Re-measurement of employee benefits continue to be recognized in Other Comprehensive Income (OCI) and not reclassified to income.

MPI's Response: This recommendation is a contravention of current IFRS standards and would result in a qualified opinion by our external auditors.

CAC Recommendation #5: Return/Risk based on market values

Mercer's Response: 2017 ALM Study is based on market values.

CAC Recommendation #6: De-linking discount rates for the purpose of long-term asset allocation decision making.

Mercer's Response: Current economic assumptions for each asset class were determined independently of MPI's current asset holdings.

CAC Recommendation #7- Min/Max Constraints to be relaxed

Mercer's Response: The ALM study had minimally constrained and practical implementation constraints.

CAC Recommendation #8: Evolved Risk Framework, and
CAC Recommendation #9: Explicit Risk Management Goals

Mercer's Response: Beyond the scope of the study, framework takes significant time to develop

MPI's Response: Assets have been segmented and unique investment strategies developed that better match the underlying liabilities. Once mapped, MPI will understand its appetite per asset class to ensure pragmatic coverage of liabilities.

CAC Recommendation #10: A Minimum Risk Portfolio should be clearly defined.

Mercer's Response: Minimum risk portfolio for MPI's Basic Liabilities assuming 2% inflation on a go-forward basis consists of: Federal Short-Term Bonds 28%, Federal Mid-Term Bonds 18%, Federal Long-Term Bonds 54%.

CAC Recommendation #11: Canadian Equities 10% Minimum Allocation be reconsidered; and
CAC Recommendation #12: Exposure to International Equities to be reconsidered

Mercer's Response: Proposed consolidated portfolio has 3% exposure to Canadian equities, and 7% total to Global and Global Low Vol Equities.

CAC Recommendation #13: No Over-Reliance on Quantitative Modeling

Mercer's Response: Mercer agrees that investors should not rely solely on quantitative modeling. The ALM process began with projections of the risk, return, and correlation of a variety of asset classes. The ALM process concluded with a thorough discussion of practical considerations and observations regarding the current market environment.

CAC Recommendation #14: The use of Real Return Bonds (RRBs) in effectively managing risks

Mercer and MPI's Response: Given low current inflation expectations Mercer and MPI agreed to hedge nominal, not real interest rate risk. Prior discussions with intervenors identified high inflation scenarios as a relatively low risk.

CAC Recommendation 16: Use of Leverage for Real Estate and Infrastructure

Mercer's Response: ALM study considered use of leverage, but it is not material or worth hedging.

CAC Recommendation 17: Removal of 105% Rule in Investment Policy Statement

Mercer's Response: Support its removal.

MPI's Response: MPI has already removed this rule from the Investment Policy Statement (IPS).

CAC Recommendation 18: Pension Fund

Mercer's Response: The objectives, risk tolerances, and characteristics of each liability, including pension liabilities, were assessed separately in the study. Mercer's study recommended individual target asset mixes for the pension liabilities and other lines of business. Once implemented, the assets backing the pension obligations will no longer be commingled with the assets backing MPI's other obligations.

INV.2.1.3 Use of Duration Matching instead of Hybrid/Bucket Approach

CAC Recommendation #15 says:

> *"The effectiveness of the duration policy should be reviewed, given the inherent risks of changing real interest rates and unexpected inflation arising from MPI's liabilities, and exposure to changes in nominal interest rates in the MPI portfolio (i.e., nominal bonds without inflation protection). More specifically, MPI should re-assess the effectiveness of its duration-matching strategy since inflation (actual and/or expected) may differ from current expectations."*

Hybrid/Bucket approach combines the merits of duration matching (low cost effective matching of interest rate risk) and cash flow matching. A hybrid/bucket approach is more costly to implement and administer than duration matching. A hybrid/bucket approach matches convexity risk more closely than duration matching. Convexity risk is the risk of non-parallel shifts in the yield curve.

Mercer states that a hybrid/bucket approach is appropriate for investors with very limited risk tolerance over the short term, and who have the capability to implement a sophisticated matching program. For investors who can tolerate modest levels of risk over the short term, and target excess returns from active management, Mercer recommended a duration matching approach. A duration matching approach allows for more efficient implementation and a broader opportunity set.

A hybrid/bucket strategy is more expensive than duration matching, but does reduce convexity risk, which is the risk of non-parallel shifts in the yield curve. However, convexity risk is generally equally likely to result in a gain or loss and, therefore, over time this risk is expected to even out.

Cash flow matching and a hybrid of duration and cash flow matching (a "hybrid/bucket approach") were considered, but rejected. Duration matching provides the greatest flexibility to the fixed income manager as there are an infinite number of portfolios that can be constructed that will provide a duration that matches the duration of the Basic claims liabilities.

Cash flow matching is costly and difficult to implement, particularly when future liability cash flows far in the future are uncertain. Cash flow matching is more common for short-term liabilities where the timing and amount of the liability cash flows are known with absolute certainty. This is not the case for MPI's claims liabilities.

The Corporation will continue to monitor its assets and liabilities in appropriate time buckets and stress test alternate non-parallel interest rate scenarios to ensure sensitivities to various market movements are understood and within management's risk tolerance.

INV.2.1.4 ALM Technical Conference

On March 14th, 2018 the Public Utilities Board (PUB) facilitated a technical conference on the ALM study. The concepts and details of the ALM study were discussed by those

in attendance. The Corporation received a list of 32 questions from the PUB subsequent to the technical conference. Responses are provided in *INV Appendix 17*.

INV.2.2 ALM Transition Plan

For the purposes of the financial model, the transition to the new investment strategy developed during the ALM Study is expected to occur in Q4 2018/19.

The detailed ALM transition plan is in *INV Appendix 15*. The Implementation Plan discusses the rationale for changes to the asset allocation, including the rationale for each of the new asset classes, recommended asset allocations, implementation plan for 2018/19 and 2019/20, accounting changes, and financial impacts. Figure INV- 6 shows the current asset target mix as of April 30, 2018.

Figure INV- 6: April 30, 2018 Asset Target Mix

Line No.	Asset Class Group	Target
1	**Cash and short-term**	0.0%
2	**Fixed Income**	
3	**Government Bonds**	45.0%
	Corporate Bonds	5.0%
4	**Non-Marketable Bonds**	20.0%
5	**Total Debt**	70.0%
6	**Public Equities**	
7	**Canadian**	10.0%
8	**U.S.**	5.0%
9	**Total Public Equities**	15.0%
10	**Alternatives**	
11	**Real Estate**	10.0%
12	**Infrastructure**	5.0%
13	**Total Alternatives**	15.0%

The transition will require selling growth assets (equities, real estate and infrastructure) in order to purchase additional fixed income assets. The transition is

expected to be completed by Q4 2019/20 as illiquid asset classes such as real estate and infrastructure must be partially sold. The proceeds of MUSH maturities will be used to fund the purchase of asset classes such as corporate bonds, private debt, global equities and global low volatility equities. Manager searches must be conducted and accounting systems and processes must be redesigned to accommodate the separation of the commingled portfolio.

Figure INV- 7 shows the new asset target mixes for Basic Claims, RSR and Employee Future Benefits.

Figure INV- 7: Asset Mix to be Implemented End of Q4 2018/19

Line No.	Target Weights	Basic Claims	RSR	Employee Future Benefits
1	**Fixed Income**			
2	**Provincial Bonds**	60.0%	20.0%	0.0%

10	**Total Equities**	**0.0%**	**35.0%**	**35.0%**
11	**Alternatives**			
12	**Canadian Real Estate**	0.0%	10.0%	15.0%
13	**Infrastructure**	0.0%	5.0%	10.0%
14	**Total Alternatives**	**0.0%**	**15.0%**	**25.0%**

INV.2.2.1 Pre-ALM vs Post-ALM Financial Impact

For Basic there was $100.0 million in unrealized equity gains at February 28, 2018 and the financial model is forecasting the unrealized gains on equities to grow to $116.2M at the end of 2018/19 based on the expected return of the asset class.

Figure INV- 8: Financial Impact to Basic Line of Business

Line No	Scenario	2018/19	2019/20	2020/21	2021/22	2022/23
	Ending Asset Values (C$ 000,000's)					
1	**Basic Net Income**					
2	**GRA Forecast - ALM**	135,556	17,901	17,675	1,605	(9,795)
3	**GRA Forecast - No ALM**	40,309	19,944	22,503	16,678	2,558
4	**Difference**	95,247	(2,043)	(4,828)	(15,073)	(12,353)
5	**Basic Investment Income**					
6	**GRA Forecast - ALM**	191,814	82,148	84,863	87,773	90,599
7	**GRA Forecast - No ALM**	85,886	86,935	90,781	94,064	98,158
8	**Difference**	105,928	(4,787)	(5,918)	(6,291)	(7,559)
9	**Basic Total Equity**					
10	**GRA Forecast - ALM**	254,420	280,173	306,951	318,291	319,069
11	**GRA Forecast - No ALM**	257,449	285,668	315,890	340,406	351,259
12	**Difference**	(3,029)	(5,495)	(8,939)	(22,115)	(32,190)
13	**Basic MCT Ratio**					
14	**GRA Forecast - ALM**	69%	70%	70%	70%	66%
15	**GRA Forecast - No ALM**	54%	54%	56%	59%	59%
16	**Difference**	16%	15%	14%	11%	7%

- Basic net income is forecasted to increase by $95 million in 2018/19. This increase is primarily a result of the realization of AOCI on equity assets. This is forecasted to occur with the separation of assets into unique portfolios at the end of 2018/19.

- Total equity is forecasted to be lower because investment asset returns are forecasted to be lower with fewer growth assets after ALM implementation.

- The MCT ratio will increase by ~16% at the end of 2018/19 from 54% to 69% because of lower capital requirements on the Basic line of business investment assets. Interest income is forecasted to increase by approximately $18.5

million on average from 2019/20 to 2021/22 as there will be more fixed income assets in the portfolio supporting the Basic line of business. These projections are based on a naive interest rate forecast.

The impact to the rate indication from the ALM implementation are minimal. The break-even rate indication using the naive interest rate forecast and the impact of the ALM changes is 0.1%; when the capital maintenance provision is included the rate indication is 2.2%. Without the ALM changes, the break-even rate indication using the naive interest rate forecast is -0.1% and 1.9% with the capital maintenance provision.

INV.2.2.2 Reduction in Basic Interest Rate Risk

With a commingled investment portfolio, interest rate risk was managed on a Corporate basis by matching the Corporate assets to Corporate claims liabilities. However, this caused a dollar mismatch between Basic assets and Basic claims. By separating Basic assets to match the Basic claims liabilities, interest rate risk has been significantly reduced for the Basic line of business.

To illustrate, for each year from 2019/20 to 2021/22, the GoC 10 year bond rate was increased by 100 basis points on the last day of each fiscal year. The figure below shows the net impact when the Basic line of business is segregated in the 2019 GRA and compares the impact to last year's rate application (using the results shown in the response to the 2018 GRA PUB 1-43). The decrease in interest rate risk from the changes is a result of separating the Basic Claims portfolio from the commingled corporate portfolio.

Figure INV- 9: +100 Bps GoC 10 Year Bond Impact Comparison – 2018 GRA and 2019 GRA

Line No.		2019/20	2020/21	2021/22
1	**2018 GRA**			
2	Marketable Bond G/L	(113.0)	(117.1)	(120.1)
3	Claims Interest Rate Impact	(145.9)	(153.0)	(158.2)
4	Net Impact	32.9	35.9	38.1
5	**2019 GRA**			
6	Marketable Bond G/L	(131.6)	(144.5)	(154.8)
7	Claims Interest Rate Impact	(134.1)	(142.2)	(153.8)
8	Net Impact	2.5	(2.3)	(1.0)

On average the net impact shown in the 2019 GRA was ($0.3M) compared to $35.6M in the 2018 GRA. Further discussion on interest rate risk can be found in *INV.16*.

INV.2.3 Naive Interest Rate Forecast

Interest rate forecasting risk is a significant concern for MPI as inaccurate forecasts have had material impacts on the financial results of the Basic line of business. For example the net impact of changes in interest rates for Basic was a loss of $35.8M in 2014/15 and a gain of $23.7M in 2015/16. Interest rate forecasting risk, for the purpose of this application, is the uncertainty related to setting premium rates based on forecasted interest rates rather than based on future actual interest rates, and the impact of the difference between those interest rates.

PUB Order 130/17 Directive 11.19 stated that:

> *"The 50/50 interest rate forecast shall be used for rate-setting and target capital purposes." The Corporation complied with this directive in its compliance filing to Order 130/17.*

MPI is required to base its rate application on best estimates, and for the 2019 GRA, MPI's management and Board of Directors continue to maintain that the naïve forecast is the best estimate. This position is supported by the analysis below, and the opinion

of MPI's external actuary, Mr. Joe Cheng who stated in his August 30, 2017 letter (2018 GRA PUB(MPI) 2-7 Attachment A) that he reviews over 30 DCAT reports annually, and a naive forecast is the most common for the base scenario. Further Mr. Cheng states that the naive interest rate forecast is a reasonable base forecast because:

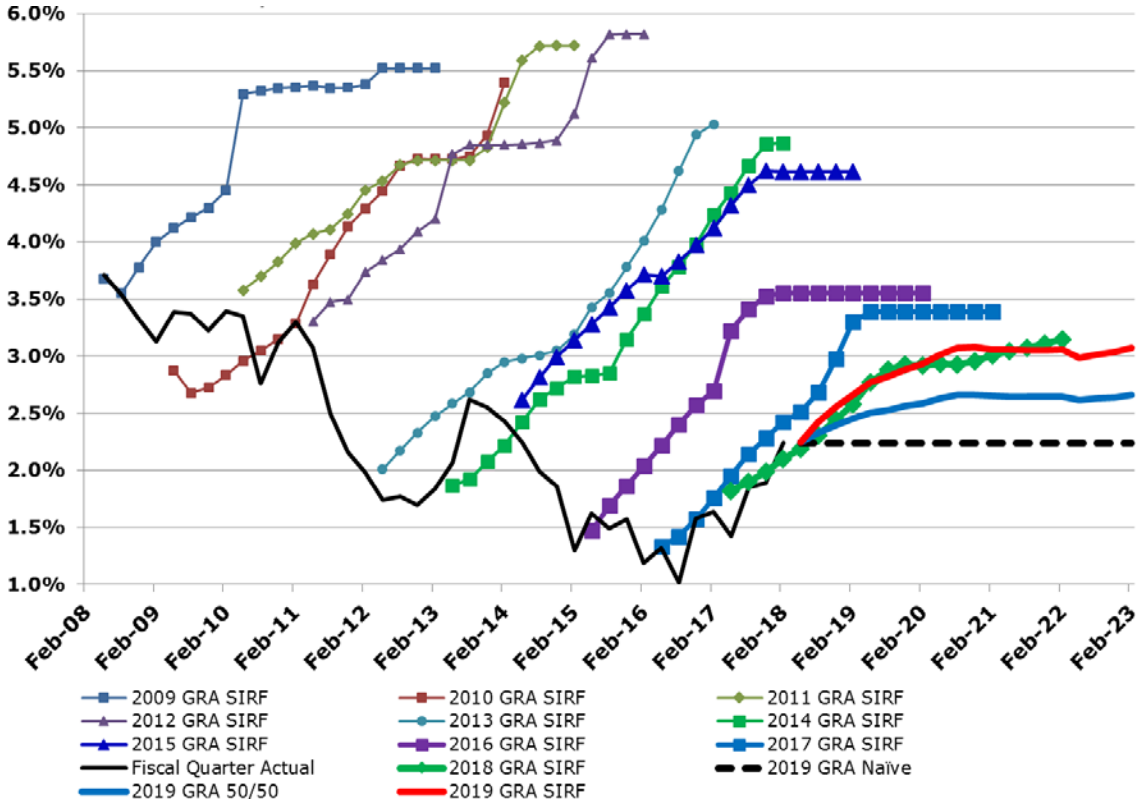
> *"1) nobody can forecast interest rates (especially long term bonds) accurately and consistently; and 2) the bond market is efficient and the current market yield reflects the expectation of the investors of that date."*

Pro forma financial statements using the 50/50 interest rate forecast are shown in *INV Appendix 10*.

INV.2.3.1 Historical Analysis of the Naive, 50 50 and SIRF Forecasts

For graphical representation, the historical forecasts of the GoC 10-year bond yield from 2009 GRA to 2019 GRA are shown in Figure INV- 10, as represented by the coloured lines with markers. This year's interest rate forecast using the standard interest rate forecast (SIRF) methodology (thick red line), the 50/50 forecast (thick light blue line) and the naive forecast (dotted black line) are included in this chart. The thick black line represents the actual GoC 10-year bond rate. The SIRF has performed poorly over the period depicted, a fact that is apparent on simple visual inspection.

Figure INV- 10: GoC 10 Year Forecasted Rates from 2009 to 2019 GRA and Actual



The naive and SIRF forecasts from the 2005 GRA to the 2018 GRA were compared to the actual GoC 10 year bond yields after 12 months. See *Figure INV- 11* for the analysis. Over 12 months, the naive forecast had a lower standard error compared to the 50/50 forecast and the SIRF.

Figure INV- 11: Historical Analysis of SIRF, 50/50 and Naïve Forecast from 2005 to 2018 GRA

Line No.		SIRF Forecast	Actual	Difference	50/50 Forecast	Actual	Difference	Naïve Forecast	Actual	Difference

INV.2.3.2 Rate Indication under 50/50 and SIRF Interest Rate Scenarios

Figure INV- 12 shows the rate indication with and without the capital maintenance provision under the naive, 50/50 and SIRF scenarios. The breakeven rate indication varies from 0.1% using the Naive interest rate forecast, -0.5% using the 50/50 forecast and -1.0% using SIRF.

Figure INV- 12: Rate Indication Table

Line No	Scenario	New Money Yield	Breakeven Rate Indication	Breakeven Rate Indication with Net CMP	18/19 MCT	19/20 MCT Before Net CMP	19/20 MCT After Net CMP
1	**Naïve**	3.21%	0.1%	2.2%	69.5%	63.6%	69.5%
2	**50/50**	3.50%	-0.5%	1.2%	72.7%	67.8%	72.7%
3	**SIRF**	3.79%	-1.0%	0.4%	75.8%	71.7%	75.8%

The interest rate forecasting methodology impacts the 2019 GRA rate setting by impacting the marketable bond yield at September 1, 2019. The marketable bond yield is referred to as the new money yield, as shown in the previous figure. Further discussion on new money yield can be found in *Part V (ii) Ratemaking*.

INV.3 CASH/SHORT TERM

As of February 28, 2018 cash represented 3.2% of the total portfolio. Cash has a target weight of 0%, and a 0% forecasted weight throughout the 5 forecast years.

INV.3.1 Summary Table

Figure INV- 13: Short Term Summary

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23
	(C$000s, except where noted)

4	**% of the Portfolio**	0.0%	0.0%	0.0%	0.0%	0.0%

INV.3.2 Definition and Accounting Treatment

Definition: Cash and Short-Term holdings are defined as cash and fixed income investments having a maturity of less than one year at the time of purchase. All fixed income securities are managed by the Department of Finance.

Accounting: Cash is reported at face value on the financial statements. Interest income flows through the Profit and Loss statement.

INV.3.3 Return Assumption

The five year forecasted cash returns are based on the Generic Canadian Government Bonds 3 Month Bill value from Bloomberg as of February 28, 2017. Please see *Figure INV- 43* for 91-day Treasury-bill forecast on a quarterly basis.

INV.4 MARKETABLE BONDS

Marketable bonds make up 45.5% of the total portfolio as of February 28, 2018, which consists of 41.3% government bonds and 4.2% corporate bonds. Government bonds are reclassified as Provincial bonds at the end of Q4 2018/19.

After investment assets are separated into unique portfolios at the end of 2018/19, the target weights for Provincial bonds will change to a target weight of 60% for Basic Claims, 20% for RSR and 0% for Employee Future Benefits. For corporate bonds, the target weights will change to 20% for Basic Claims, 10% for RSR and 20% for Employee Future Benefits.

INV.4.2 Definition and Accounting Treatment

Definition: Marketable bonds include all fixed income securities with a maturity of one year or more at the time of purchase and include Canada, Manitoba, other provincial, municipal and corporate bonds, floating rate notes, and debentures that are tradable in the fixed income market. All fixed income securities are managed by the Department of Finance.

Accounting: Unrealized and realized gains/losses, amortization and interest income flow through the Profit and Loss statement.

INV.4.3 Interest and Capital Return Assumptions

Income from the marketable bond portfolio is separated into two components. The first component is interest income and the second component is the capital return (both realized and unrealized gains/losses).

INV.4.3.1 Interest Income

Marketable bond interest income is calculated on a quarterly basis using the weighted average coupon rate for bonds currently within the portfolio, the yield for newly purchased bonds, and the forecasted bond turnover rate. In each quarter, the previous quarter's weighted average coupon yield is adjusted by: (1) the marketable bond turnover rate; and (2) the forecasted marketable bond yield in order to calculate the new weighted average coupon yield for the entire marketable bond portfolio for that quarter. These components are discussed in further detail below. The interest income calculation is the same for both government/provincial and corporate bonds.

INV.4.3.2 Weighted Average Coupon for Existing Bonds

The weighted average coupon is used to calculate the interest from the marketable bond portfolio (government/provincial bonds, corporate bonds). To illustrate the concept of the weighted average coupon, a theoretical $1 billion dollar bond held at par value with a weighted average coupon of 5.0% will generate $50 million dollars in interest within one year. The actual weighted average coupon as of February 28, 2018 was 3.68% for government bonds and 4.16% for corporate bonds. These coupon rates were used as the initial coupon rate in the model in Q4 2018/19.

INV.4.3.3 Turnover

The weighted average coupon of the marketable bond portfolio (government/provincial bonds, corporate bonds) for each successive quarter is

calculated by adjusting the previous quarter's weighted average coupon for the impact of turnover (i.e. buying and selling bonds) in the current quarter. If new bonds are purchased at a lower (higher) yield than the weighted average coupon in the model, then the weighted average coupon of the marketable bond will decrease (increase).

Turnover indicates how often marketable bond holdings are sold in the portfolio. Turnover can be reported in two ways: the percentage of the portfolio holdings sold in one year (turnover ratio) or the number of years to turn over the entire portfolio (which is the inverse of the turnover ratio).

Since February 2008, the historical turnover for the fixed income portfolio has been 0.65 on average. At this level of turnover, the entire marketable bond portfolio would be replaced with new bonds at the forecasted rates within 1.71 years. The range for annual marketable bond turnover varies from 0.36 to 0.96. If the highest and lowest turnover ratios are removed, the average turnover ratio remains at 0.65. *Figure INV-18* shows the sensitivity of marketable bond turnover on Basic investment income.

Figure INV- 17: Marketable Bond Turnover

Line No.	Date	Beginning	End Period	Average	Minimum Buys/Sells	Ratio	Years to Turnover the Portfolio
	(C$000s, except where noted)						
1	**Feb 2018**	1,107,933,784	1,269,489,679	1,188,711,732	752,221,082	63%	1.58

	(C$000s, except where noted)					
1	**-**	193,192	80,872	82,990	85,274	87,656
2	**0.20**	192,775	81,389	83,870	86,685	89,429
3	**0.40**	192,317	81,770	84,449	87,405	90,210
4	**0.60**	191,904	82,079	84,793	87,715	90,543
5	**0.65**	191,814	82,148	84,863	87,773	90,599
6	**0.80**	191,546	82,291	85,021	87,891	90,677
7	**1.00**	191,210	82,463	85,154	87,969	90,718

Assumption: The turnover ratio for the marketable bond portfolio is forecasted to be 0.65 over the five year forecast.

INV.4.3.4 Yield to Maturity Calculation for 2018/19

The yield to maturity for government bonds and corporate bonds in 2018/19 was calculated based on a spread over the forecasted GoC 10 year bond yield. The spread varies according to the duration of the relevant marketable bond portfolio for the forecasted quarter. This spread is referred to as the duration spread.

Government Bond Spread

The government duration spread is calculated using the historical spread of provincial bonds over the GoC 10-year bond rate as of February 28, 2018 at various levels of duration and applying this spread to the forecasted GoC 10-year bond rate. The spread of Provincial bonds over GoC 10-year bonds was used as a proxy for the marketable bond portfolio yield, and the data source is Bloomberg.

Given the sensitivity of the claims duration to changes in interest rates, marketable bonds that have duration between 9.0 years and 15.0 years are linearly interpolated by the model.

Provincial bonds with a 9-year duration had a spread of 67 basis points over the GoC 10-year bond rate as of February 28, 2018. Provincial AA rated bonds with a 15-year duration had a spread of 87 basis points over the GoC 10-year rate. Based on this information, the spread between a 9-year duration bond and a 15-year duration bond was 20 basis points.

Figure INV- 19 applies this 20 basis points spread for durations between 9 and 15 years used in the model, increasing on a linear basis for each additional year of duration. As of February 28, 2018, the marketable bond portfolio had a duration of 11.7 years and a spread of 77 basis points over the GoC 10-year bond rate (3.01% compared to 2.24% GoC 10 year bond yield). This data point was used as the starting point in the table below to determine the duration yield spread on a linear basis.

Figure INV- 19: Government Bond Yield Spread

Line No.	Year Ending	Marketable Bond Duration
1	**9.0 years**	67 bps
2	**10.0 years**	70 bps
3	**11.0 years**	74 bps
4	**12.0 years**	77 bps
5	**13.0 years**	80 bps
6	**14.0 years**	84 bps
7	**15.0 years**	87 bps

Corporate Bond Spread

The corporate bond yield was 3.35% as at February 28, 2018, which was a 1.11% duration spread over the GoC 10 year bond yield of 2.24%. It is assumed when BBB rated bonds are added to the corporate portfolio in 2018/19, the duration spread will increase to 1.66% in order for the corporate bond yield (to maturity) to match the FTSE Corporate long term index yield of 3.90% as at February 28, 2018. By Q4 2018/19 the corporate bond yield to maturity is 3.90% with the naive forecast (2.24% GoC 10 year bond yield plus 1.66% duration spread).

INV.4.3.5 Yield to Maturity Calculation for 2019/20 and Thereafter

The consolidated marketable bond portfolio is separated into separate unique portfolios at the end of Q4 2018/19 when the ALM transition occurs. There are four fixed income portfolios that are modeled for the Basic Claims portfolio and the RSR portfolio: 1) provincial bonds for Basic Claims, 2) provincial bonds for RSR, 3) corporate bonds for Basic Claims 4) corporate bonds for RSR.

Provincial Bond Spread

The provincial bond spread uses the same duration spread as government bonds in 2018/19. To illustrate using the naive interest rate forecast:

- The duration of the provincial bond portfolio is 10.1 years as Q4 2019/20. The duration spread over the GoC 10 year bond is 71 basis points. The provincial bond yield to maturity for the quarter is 2.95% (2.24% GoC 10 year bond rate plus 0.71%).
- By 2022/23, the duration of the provincial bond portfolio falls to 9.9 years, causing the duration spread to equal 70 basis points for a provincial bond yield to maturity of 2.94% (2.24% GoC 10 year bond rate plus 0.70%)

Provincial Bond Spread for RSR

The duration for provincial bonds in the RSR portfolio is based on 50% of the short-term provincial index (2.85 years) and 50% of the mid-term provincial index (4.65 years) for a combined assumed duration of 4.65 years as at February 28, 2018. The provincial spread over GoC 10 year bonds is assumed to be 0.09% based on the provincial spread as at February 28, 2018. As a result, the yield to maturity for provincial bonds in the RSR portfolio with the naive forecast is 2.33% (2.24% GoC 10 year bond yield plus 0.09% duration spread).

Corporate Bond Spread for Basic Claims

The corporate bond spread over the GoC 10 year bonds is forecasted to match the FTSE Corporate long term index yield of 3.90%, which is the yield of the index as of February 28, 2018.

Corporate bonds for Basic Claims are assumed to have a duration of 9.9 years. The corporate bond duration spread is forecasted to be 166 basis points. The naive Government of Canada 10 year bond yield was 2.24% plus 1.66% duration spread for a forecasted corporate bond yield of 3.90%.

Corporate Bond Spread for RSR

The duration for corporate bonds in the RSR portfolio is based on FTSE Mid-Term Corporate bond index, which was 6.2 years. The spread for a corporate bond with a duration of 6.2 years was assumed to be 1.09%. This spread was based on the historical spread of corporate bonds over the GoC 10-year bond rate as of February 28, 2018 (source: Bloomberg). The yield to maturity for corporate bonds in the RSR portfolio with the naive forecast is 3.33% (2.24% GoC 10 year bond yield plus 1.09%).

INV.4.3.6 Capital Return

Rising interest rates result in unrealized losses in the marketable bond portfolio, and falling interest rates result in unrealized gains. The model uses the forecasted GoC 10-year bond rate to calculate the change in interest rates on a quarterly basis. The marketable bond duration, convexity and change in interest rate are used to calculate the capital return.

INV.4.3.7 Duration

Duration measures the impact of changes in interest rates on the market values of fixed income assets. The marketable bond duration as of February 28, 2018 was 11.7 years.

As per Section 8.4 of the Investment Policy Statement (*INV Appendix 1*), the marketable bond duration is matched to the claims duration to minimize the interest rate risk of MPI. In last year's rate application, the total fixed income portfolio including MUSH bonds was matched to the claims duration. The duration matching policy has been changed this year to exclude MUSH bonds due to a change in the calculation methodology for the claims discount rate, which is now based upon the dollar weighted yield of the fixed income portfolio rather than the duration weighted yield of the fixed income portfolio.

As a result, the duration of the marketable bond portfolio will decrease by approximately 2 years. The decrease in the marketable bond duration is forecasted to occur at the end of Q1 2018/19.

Within the model the government/provincial bond duration changed so that the total marketable bond portfolio duration (government/provincial and corporate bonds) is matched to the previous quarter's claims duration. This one quarter lag between matching the government/provincial bond duration and claims liability duration reflects the reality that the claims liability number must be known before the fixed income duration can be changed to match. Corporate bond duration is assumed to be static at 9.9 years for the entire 5 year forecast.

Figure INV- 20 provides the forecasted marketable bond duration, the claims duration and the duration gap that is calculated by the model at each year end.

Figure INV- 20: Duration Assumption in Model

Line No.	Year Ending	Marketable Bond Duration	Claims Duration with PfAD (prior quarter)	Duration Gap
2	**Feb 19**	9.5	9.6	(0.0)
3	**Feb 20**	10.1	10.1	-
4	**Feb 21**	10.0	10.0	-
5	**Feb 22**	10.0	10.0	-
6	**Feb 23**	9.9	9.9	-

Figure INV.11 (rebalancing) discusses the dollar matching of the fixed income portfolio to MPI's claims liabilities on an annual basis. Please see *INV Appendix 2* for more detailed information on the Investment Committee Working Group's Operational ALM Policy. Finally, please see *INV.16* for a discussion of interest rate risk and further detail on the ALM program.

Assumption: A duration gap target of 0.0 years is assumed for the entire forecast period.

INV.4.3.8 Convexity

Convexity[1] measures the changes in bond prices that are not explained by duration.

- The convexity of the Corporation's marketable bond portfolio was 2.31 as of February 28, 2018, as calculated by Bloomberg. This convexity was assumed for government bonds (2018/19) and for provincial bonds and corporate bonds in the Basic Claims portfolio (2019/20 and thereafter).
- Convexity for provincial bonds for RSR was 0.3, based on 50% of the short-term provincial index (0.11) and 50% of the mid-term provincial index (0.49) as at February 28, 2018.
- Convexity for corporate bonds for RSR was 0.47, based on the mid-term corporate bond index convexity as at February 28, 2018

[1] Convexity accounts for the non-linearity of changes in bond prices due to changes in interest rates. It is the second derivative of the change in bond price.

INV.5 NON-MARKETABLE BONDS (MUSH) AND PRIVATE DEBT

Non-marketable bonds make up 22.1% of the total portfolio as of February 28, 2018. No further MUSH purchases are forecasted. As a result, MUSH bonds are forecasted to be 14.7% of the Basic Line of Business portfolio by the end of 2022/23.

Private debt is a new asset class, and is forecasted to be funded from Q1 to Q4 2019/20. Private debt has a target weight of 0% for Basic claims, 15% for RSR and 20% for EFB.

INV.5.1 Summary Table

Figure INV- 21: MUSH Summary Table

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23

3	**End of Period Yield**	0.00%	5.32%	5.32%	5.32%	5.32%
4	**% of Portfolio**	0.0%	2.2%	2.1%	2.0%	1.9%

INV.5.2 Definition and Accounting Treatment

Definition: Non-Marketable Bonds (MUSH bonds) are bonds and debentures issued by Manitoba rural municipalities, school divisions and health care

facilities which are not tradable in the fixed income market. All fixed income securities are managed by the Department of Finance.

Private debt is privately held debt that is not traded publicly in the market. It is forecasted that private debt will be investment grade and managed by an external pooled fund manager.

Accounting: MUSH bonds are held at book value on the financial statements. Interest payments flow through the Profit and Loss statement. Private debt will be classified as Fair Value through Profit and Loss. Unrealized and realized gains/losses and interest income will flow through the Profit and Loss statement.

INV.5.3 Interest Income Assumption

Non-marketable bonds (MUSH bonds) provide additional yield over a GoC 10-year bond and the yield on the existing portfolio was forecasted for the next five years. There are no MUSH purchases forecasted over the 5 year forecast since the availability of new MUSH issuance has decreased.

Private debt is forecasted to have a spread of 142 basis points over the forecasted corporate bond yield. However, based on conversations with private debt managers, the spread could be as low as 75 basis points to 100 basis points. Since this is a new asset class, this forecasted spread is subject to change in next year's rate application as further information is gathered on the asset class. The variance in forecasted spread assumption has minimal impact on investment income for the Basic line of business since private debt is not fully invested until the end of Q4 2019/20. The yield earned on private debt does not impact the new money yield used for rate setting purposes.

INV.5.4 MUSH Book Value and Yield Forecasting

MUSH book values and forecasted MUSH yields were calculated over the five-year forecast and entered into the financial model. The ending book values were based on using the forecasted principal repayments of the existing MUSH holdings as of Q4 2017/18.

INV.5.5 Private Debt Capital Returns

Private debt has an assumed duration of 9.5 years. Changes in the forecasted Government of Canada 10 year bond yield impact private debt capital returns using the forecasted 9.5 year duration, which indicates the level of interest rate sensitivity to changes in interest rates on the market value of private debt.

INV.6 CANADIAN EQUITIES

Canadian equities have a 10% target allocation, with a range of 7% to 13%. Canadian equities had a 9.5% actual weight as of February 28, 2018. After the transition to separation of assets into unique portfolios that is forecasted to occur at the end of 2018/19, the target weights for Canadian equities will change to a target weight of 0% for Basic Claims, 12% for RSR, and 10% for pension.

INV.6.1 Summary Table

Figure INV- 23: Canadian Equity Summary Table

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23
	(C$000s, except where noted)

2	**Realized Gains/(Losses) (P&L)**	59,363	683	0	0	0
3	**Total Investment Income**	**67,645**	**2,373**	**1,422**	**1,523**	**1,632**
4	**Forecasted Dividend Yield**	3.10%	3.20%	3.40%	3.40%	3.40%
5	**Ending Market Value**	39,550	41,262	44,188	47,322	50,774
6	**% of Portfolio**	1.8%	1.8%	1.9%	1.9%	2.0%

INV.6.2 Definition and Accounting Treatment

Definition: The Canadian equity portfolio includes publicly traded common stocks and preferred shares which are listed on a Canadian stock exchange. The Canadian equity portfolio is managed by three active managers under contract with the Department of Finance.

Accounting: Realized gains/losses and dividend income flow through the Profit and Loss statement. Unrealized gains/losses are located in the Other Comprehensive Income statement.

INV.6.3 Total Return Assumption

As directed by PUB Order 157/12, the annual equity return is forecasted to be 7.0% over the five-year forecast period. The 7.0% return is based on the 5th percentile 20-year Canadian equity return using index data starting in 1956 to February 28, 2018.

The model splits up total return into dividend yield and capital return:
total return = dividend yield + capital return.

INV.6.4 Dividend Yield

The dividend yield is used to calculate the dividend income in the model. Dividend income for each quarter is calculated using the quarterly market value of the Canadian equity portfolio multiplied by the quarterly dividend yield. All dividends are re-invested back into the Canadian equity portfolio.

The dividend yield for Canadian equities is based upon a forecast from Bloomberg. Bloomberg only forecasts three years into the future. The forecasted dividend yield for the S&P/TSX for the next three fiscal years is as follows:

- 2018/19: 3.1%
- 2019/20: 3.2%
- 2020/21 and thereafter: 3.4%

Assumption: The Canadian equity dividend yield is forecasted to be 3.1%, 3.2% and 3.4% in 2018/19, 2019/20 and 2020/21 respectively. 3.4% is used for 2021/22 and 2022/23.

INV.6.5 Capital Return

The capital return determines the Canadian equity portfolio's increase in market value over each period. Increases in market value from the capital return are held as

unrealized gains, which are held in AOCI. Therefore, the capital return component does not impact net income unless there are sales (turnover) of holdings within the portfolio. The capital return for each forecasted year is determined by subtracting the dividend yield from the total rate of return of 7.0%.

INV.6.6 Turnover

The turnover ratio, as programmed in the model, indicates how often equity holdings are sold. When equities are sold, the corresponding unrealized gains in AOCI are then realized and flow through net income. The average mid-point of the range for the manager's expected future turnover was 20%. Based on this information, a 20% turnover ratio was used in the model for 2018/19. However, after separation of asset classes in the financial model occurs in at the end of Q4 2018/19, the forecasted turnover rate thereafter will be 0% because it is expected that equity holdings will be held in pooled funds.

Assumption: The forecasted equity turnover ratio used is 20% in 2018/19. For 2019/20 and thereafter the forecasted turnover is 0%.

INV.7 U.S. EQUITIES/GLOBAL EQUITIES AND GLOBAL LOW VOL

For 2018/19, U.S. equities have a target weight of 5% and had a 5.2% actual weight as of February 28, 2018.

After the transition to separation of assets into unique portfolios that is forecasted to occur at the end of 2018/19, the target weights for Global equities will be 0% for Basic Claims, 13% for RSR and 18% for EFB. For Global Low Volatility the target weights will be 0% for Basic Claims, 10% for RSR and 7% for EFB.

INV.7.1 Summary Table

Figure INV- 24: U.S. / Global Equities Summary Table

5	**Ending Market Value**	32,958	35,092	37,364	39,783	42,359
6	**% of Portfolio**	1.5%	1.6%	1.6%	1.6%	1.7%

INV.7.2 Definition and Accounting Treatment

Definition: U.S. equities are publicly traded stocks which are listed on a recognized stock exchange in the United States.

Global equities are publicly traded stocks, which are listed on a recognized stock exchange in the U.S., Europe or Asia (developed markets only).

Global low volatility stocks are publicly traded stocks in the same markets as Global equities. Low volatility stocks have less volatility than other stocks in their parent index.

Accounting: Realized gains/losses and dividends flow through the Profit and Loss statement. Unrealized gains/losses flow through Other Comprehensive Income.

INV.7.3 Total Return Assumption

The total return on the U.S. and Global equity portfolio is forecasted to be 7.0%, which matches the Canadian equity total return. The forecasted total return for Global low volatility stocks is 6.4%, which is 0.6% lower. This difference was based on

Mercer's capital market assumption difference in return for global equities and global low volatility.

INV.7.4 Dividend Yield

The dividend yield is used to calculate the U.S./Global Equity/Global Low Volatility dividend income in the model. Dividend income for each quarter is calculated by using the quarterly market value of the equity portfolio multiplied by the quarterly dividend yield. All dividends are re-invested back into the equity portfolio.

The dividend yield for the U.S./Global Equity/Global Low Volatility equity portfolio is based upon a forecast from Bloomberg. Bloomberg only forecasts 3-years into the future.

Using the same methodology as last year, the forecasted dividend yields for the Russell 1000 Value and Russell 2000 Value indices from Bloomberg are used as the dividend yield forecast for 2018/19. The Russell 1000 Value and Russell 2000 Value dividend yields were combined with an 80%/20% weighting, which mirrors the target index weighting of the actual U.S. equity portfolio.

For the Global equity and Global low volatility, the MSCI World index forecasted dividend yield was used for 2019/20 and thereafter.

Figure INV- 26: Bloomberg Expected Dividend Yield Forecast

Line No.	Index	Russell 1000 Value and Russell 2000 Value (80% / 20%)	MSCI World
1	**2018/19**	2.3%	
2	**2019/20**		2.7%
3	**2020/21**		2.8%
4	**Thereafter**		2.8%

Assumption: The U.S equity dividend yield is forecasted to be 2.3% for 2018/19. For global equity and global low volatility a 2.7% dividend yield was used for 2019/20 and 2.8% thereafter.

INV.7.5 Capital Return

The capital return determines the U.S./Global Equity/Global Low Volatility equity portfolio's increase in market value over each quarter. Increases in market value from the capital return create unrealized gains, which are held in AOCI. Therefore, the capital return component does not impact net income unless there are sales (turnover) in the portfolio. The capital return for each year is determined by subtracting the dividend yield (section *INV.7.4*) for each forecasted year from the total U.S./Global Equity/Global Low Volatility equity return of 7.0% (section *INV.7.3*).

INV.7.6 Turnover Ratio

The turnover ratio for U.S. equity is forecasted to be 100% in 2018/19. In Q4 2018/19, all U.S. equity holdings will be liquidated in order to fund the purchase of Global Equities and Global Low Volatility equities. Once purchased, the turnover ratio of Global Equities and Global Low Volatility equities is forecasted to be 0%.

Assumption: The turnover ratio for U.S. equities in 2018/19 is expected to be 100%. Turnover for Global Equity/Global Low Volatility equities for 2019/20 and beyond is forecasted to be 0.

INV.8 REAL ESTATE

As of February 28, 2018, the real estate portfolio in the investment portfolio had a 10% target allocation and had an actual weight of 10.9% in the total portfolio. There are two main components to the real estate portfolio. The first are holdings in a real estate pooled fund, which had a weight of 8.8%. The second is the investment portion of Cityplace (MPI-owned office and retail complex), which had a weight of 1.6%.

After the transition to separating assets into unique portfolios that is forecasted to occur in the financial model at the end of 2018/19, the target weights for real estate will be 0% for Basic Claims, 10% for RSR, and 15% for EFB.

INV.8.1 Real Estate Summary Table

Figure INV- 27: Real Estate Summary Table

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23
	(C$000s, except where noted)					
	Real Estate Pooled Fund					
1	**Ending Market Value**	19,053	20,215	21,428	22,713	24,076
2	**% of Portfolio**	0.9%	0.9%	0.9%	0.9%	0.9%
3	**Forecasted Return**	6.2%	6.1%	6.0%	6.0%	6.0%
4	**Real Estate Gains (P&L)**	13,984	1,162	1,213	1,286	1,363
5	**Investment Properties (Cityplace)**					
6	**Ending Market Value**	13,906	13,548	13,553	13,760	15,246
7	**% of Portfolio**	0.6%	0.6%	0.6%	0.6%	0.6%
8	**Investment Property Income**	4,236	642	837	817	771

INV.8.2 Accounting Treatment of the Pooled Fund

The assets in the real estate portfolio are separated into two categories, the Real Estate Pooled Fund and the Investment Properties, since they have different accounting treatments. Investment Properties (Cityplace) will be discussed in section *INV.8.5*.

Definition: As of February 28, 2018, approximately $224.4 million was invested in a diversified Canadian real estate pooled fund (for the Basic line of business), which is managed by an external asset manager under contract with the Department of Finance.

Accounting: All unrealized and realized gains/losses flow through the Profit and Loss statement. Realized gains/losses would only arise if fund units were sold.

INV.8.3 Real Estate Pooled Fund Return Assumption

The return on MPI's Real Estate portfolio is based on the forecast for the Canadian Consumer Price Index (CPI) plus a spread of 4%. This assumption for real estate has been unchanged since MPI's first investment in the asset class in 2009. Please see section *INV.14.2.1* for this year's Canadian CPI forecast.

INV.8.4 Cityplace Accounting Treatment

Definition: Investment Property includes approximately $34.7 million investment in the Cityplace building and the surrounding parking lots with improvements (for the Basic line of business).

Accounting: The value of the investment property is measured at amortized cost; as such, changes in market value are not reflected in investment income or other comprehensive income. Income from investment property is in the

form of rental income from the portion of the property rented to commercial tenants. All rental income from Cityplace is net of rental expenses and amortization and flows through the Profit and Loss statement.

INV.8.5 Cityplace Return Assumption

This year's forecast is based on projections provided by the property manager less capital improvements and associated depreciation.

INV.9 INFRASTRUCTURE

Infrastructure has a 5% target allocation in the total portfolio, and had a 3.6% actual allocation as of February 28, 2018. After separating assets into unique portfolios at the end of Q4 2018/19, the target allocation for infrastructure is 0% for Basic Claims, 5% for RSR, and 10% for EFB. Like real estate, infrastructure is privately held and is not considered to be a liquid asset class.

INV.9.1 Summary Table

Figure INV- 28: Infrastructure Summary Table

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23
	(C$000s, except where noted)					
1	**Income**	1,262	239	249	263	278
2	**Infrastructure Gains (P&L)**	4,944	936	975	1,030	1,088
3	**Total**	6,206	1,175	1,224	1,293	1,365
4	**Forecasted Return**	7.2%	7.1%	7.0%	7.0%	7.0%
5	**MV**	16,479	17,415	18,390	19,420	20,508
6	**% of Portfolio**	0.8%	0.8%	0.8%	0.8%	0.8%

INV.9.2 Definition and Accounting Treatment

Definition: Infrastructure is defined as an essential service with high barriers to entry that often operate in a monopolistic and regulated environment. Infrastructure investment contracts are held with the Department of Finance.

Accounting: Income and unrealized gains/losses flow through the Profit and Loss statement. Realized gains or losses were not included in the model since sales of infrastructure are not forecasted during the five year forecast period.

INV.9.3 Return Assumption

Infrastructure is expected to provide a total return of 7.2% for 2018/19, and 7.1% for 2019/20 and 7.0% thereafter. This forecasted return is based on the Canadian CPI forecast plus a spread of 5%. Please see section *INV.14.2.1* for this year's CPI forecast.

This year, total infrastructure return is made of up two components - yield and capital return. Yield was given a 20% allocation, and capital return was given an 80% allocation of the total infrastructure return, unchanged from last year's assumption.

INV.10 OTHER INVESTMENT INCOME IMPACTS

This section discusses the other investment income impacts: investment management fees, pension expense; bond amortization; venture capital; and line of business allocations.

INV.10.1 Investment Management Fees

In order to forecast fees, investment management fees were split into three categories by type of manager. The first category includes the fees paid to the Department of Finance. The second category includes the fees paid to the Corporate bond manager. The third categories includes fees paid to all other managers (equities, real estate and infrastructure managers). Fees drop in 2019/20 because there are now significantly less growth assets in the Basic line of business portfolio, which generally incur higher fees.

Figure INV- 29: Investment Manager Fees

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23
	(C$000s)					
1	**Fees to the Department of Finance**	1,134	1,012	1,054	1,050	1,021
2	**Fees to the Corporate Bond Manager**	194	413	460	496	528
3	**Fees to the Growth Assets**	3,136	696	639	668	705
4	**Total**	**4,464**	**2,121**	**2,153**	**2,214**	**2,254**

INV.10.1.1 Department of Finance

The fixed income portfolio is managed by the Department of Finance. The Department of Finance charges a management fee of 7.5 basis points on the first $2 billion for fixed income plus 3.0 basis points for all other asset classes.

INV.10.1.2 Corporate Bond Manager

The Corporate bond portfolio will be managed by an external bond manager. The corporate bond manager is forecasted to charge a management fee of 10 basis points.

INV.10.1.3 Growth Assets

The investment management fees are based on assets under management for public equities and real estate.

INV.10.1.4 Canadian Equities

A flat average of 0.295% was used based on the weighted average fees for all of the Canadian equity managers.

INV.10.1.5 U.S. Equities/Global Equities/Global Low Volatility

The two Exchange Traded Fund holdings in the U.S. equity portfolio have fees imbedded in their structure. Therefore, no fees are paid directly to any U.S. equity managers. The fees assumed for global equities and global low volatility are 0.45% (this assumes active management).

INV.10.1.6 Real Estate Pooled Fund

The sliding fee schedule for the real estate pooled fund was used to forecast investment fees. For the first $35 million the fee is 0.86%. For the following $65 million the fee is 0.60%. For amounts greater than $100 million the fee is 0.50%.

INV.10.1.7 Infrastructure

The infrastructure portfolio consists of assets held in a fund or through direct investment. The weighted average investment fee is forecasted to be 0.74%.

INV.10.2 Pension Expense

The pension expense line, in investment income, is calculated by applying the pension discount rate to the opening pension liability. The pension discount rate has been agreed upon with our external pension actuary and used in the February 2018 actuarial analysis of the provision for employee future benefits. The pension discount rate was determined by applying the pension liabilities duration to Fiera Capital's Canadian Institute of Actuaries Method Accounting Discount Rate Curve; the rate was set at 3.43%.

For 2018/19, the pension plan expense is the reallocation of investment income to the provision for employee future benefits. This represents the expected earnings on the investment assets related to the provision for employee future benefits during the year (pension liability).

For 2019/20 and thereafter, investment assets and the underlying income have been segregated and are calculated independently from Basic and Non-Basic investment portfolios. For the purposes of financial statement reporting, employee future benefit assets are included within the Basic Investment Asset portfolio as reported on the Statement of Financial Position.

The figure below represents the forecasted investment income earned on the employee future benefit investment asset portfolio, net of the pension expense (or interest cost) requirement. Investment income is accounted for in Provision for EFB within the Statement of Financial Position.

Figure INV- 30: Investment Income on Employee Future Benefits

Line No.	Investment Summary During Period (C$000s)	2018/19	2019/20	2022/23	2023/24
1	Interest Income During Period	3,237	3,020	2,787	2,534
2	Dividend and Other Income During Period	10,078	10,427	10,800	11,202
3	Gains During Period - Profit & Loss	7,144	7,562	8,004	8,472
4	Investment Fees Paid	-1,538	-1,578	-1,628	-1,695
5	Amortization/Accretion During Period	-9	-7	-6	-5
6	Pension Expense	-14,313	-14,757	-15,207	-15,666
7	**Investment Income**	**4,599**	**4,667**	**4,750**	**4,842**

INV.10.3 Amortization of Bond Premium/Discount

The financial model calculates the amortization of the bond premium/discount for government/provincial and corporate bonds. The premium or discount is calculated as the difference between the face value of the bond and the actual purchase price. A bond purchased at a higher (lower) price than its face value will have a premium (discount) that is amortized over the remaining time to maturity of the bond. The amortization of this premium (discount) effectively reduces (increases) the interest income received based on the coupon rate of the bond.

INV.10.4 Venture Capital

As of February 28, 2018, Venture Capital was 0.05% of the total portfolio. Given the limited allocation to venture capital, investment income from venture capital is not forecasted in the model. Please see the summary investment table *Figure INV-2* to see the historical investment income from venture capital.

INV.10.5 Allocation of Investment Income to Lines of Business

All allocation formulas have been reviewed and approved by MPI's BoD for the 2018-2019 fiscal year and are based on the asset allocation methodology presented to, and

approved by, the PUB in the 2011 General Rate Application. MPI has traditionally pooled its investment portfolio and as such, investment income was allocated between the lines of business based on a formula. Please see the Figure below for the Investment Allocation Weightings calculation for 2017/18.

Figure INV- 31: Line of Business Allocation

21 ***Note 1*** *- SRE directly attributable investment income and gains on foreign exchange for U.S. fronting deposits*

The allocation of investment income throughout the forecast period has been reviewed and approved by MPI's BoD. The 2018-2019 fiscal year applies a methodology consistent to prior year's forecast; i.e. a net equity allocation formula. The 2019-2020 and subsequent forecast period applies investment income based on the direct proportion of investment assets available to each line of business.

Basic's share of investment income throughout the forecast period has been summarized below with detailed calculations provided in *INV Appendix 9*.

Figure INV- 32: Basic's Share of Corporate Investment Income (%)

2	**Non-Basic**	14.2%	12.7%	13.9%	15.9%	17.6%
3	**Total**	100.0%	100.0%	100.0%	100.0%	100.0%

INV.11 REBALANCING

Rebalancing is a major component of the Investment model, and ensures that the asset classes stay within the tolerance ranges defined in the Investment Policy Statement. This section discusses the rebalancing assumptions in the model for:

- 2018/19;
- Basic portfolio supporting the claims liabilities;
- RSR and Employee Future Benefits

INV.11.1 Corporate Rebalancing in 2018/19

A summary of the asset allocation tolerance ranges in 2018/19 for each asset class is in *Figure INV- 33* on a corporate basis. The unique asset allocations for 2019/20 and thereafter are discussed in the next section.

Figure INV- 33: Corporate Asset Allocation in 2018/19

Line No.		Minimum	Target	Max
1	**Fixed Income**			
2	**Provincial Bonds**	40.0%	45.0%	60.0%
3	**Corporate Bonds**	0.0%	5.0%	10.0%

9	**Total Equities**	**10.0%**	**15.0%**	**20.0%**
10	**Alternatives**			
11	**Canadian Real Estate**	7.0%	10.0%	13.0%
12	**Infrastructure**	2.0%	5.0%	8.0%
13	**Total Alternatives**	**9.0%**	**15.0%**	**21.5%**

With the duration matching program, interest rate risk will be managed by: (1) matching the duration of the marketable bond portfolio with the duration of MPI's claims liabilities; and (2) matching the dollar value of the total fixed income portfolio to the present value of MPI's claims liabilities. A description of the rebalancing assumptions for 2018/19 is listed below:

Duration and Dollar Matching

The dollar amount of MPI's fixed income assets is rebalanced to match the present value of claims liabilities on an annual basis. The fixed income duration is matched to the previous quarter's claims duration. This one quarter lag between matching the fixed income and claims liabilities reflects the reality that the previous quarter's claims duration must be known before the fixed income portfolio can be rebalanced to match the claims duration in the current quarter. As a result, dollar matching occurs in Q1 2018/19 based on the claim duration at the previous fiscal year-end. Dollar matching rebalancing occurs in the model only once a year if the dollar difference between assets and liabilities exceeds +/- $20 million.

Rebalancing of Equities

To facilitate dollar matching within the model, any surplus (or deficit) between the fixed income portfolio and claims liabilities is transferred to (or funded from) Canadian and U.S. equities. Canadian equities receive 66% of the inflows or outflows from the rebalancing. U.S. equities receive 33% of the inflows or outflows from the rebalancing. This ratio is consistent with the target allocation of 10% for Canadian equities and 5% for U.S. equities.

If either of the Canadian or U.S asset classes are outside of the tolerance range in any quarter, the relevant asset class is rebalanced back to the maximum or minimum weight (whichever is closer) in the same quarter.

Marketable bonds are the only suitable asset class to receive the funds. All other non-cash asset classes in the portfolio are illiquid and are not suitable to receive the excess funds (i.e. MUSH bonds, real estate and infrastructure). Therefore, to ensure the marketable bond portfolio does not hold excess funds while there is room in the U.S. equity portfolio (or Canadian equity portfolio), the U.S equity asset class is rebalanced back to the maximum weight of 7% instead of the target weight of 5%.

If Equities are at their Maximum Allocation

If there is a large surplus of funds in the fixed income portfolio relative to claims, and Canadian and U.S. equities are at their maximum weight, the surplus money is held in the marketable bond portfolio instead of cash in order to maximize the income earned. As discussed earlier, all other non-cash asset classes are illiquid and not suitable to receive the excess funds (i.e. MUSH bonds, real estate and infrastructure).

Real Estate and Infrastructure Rebalancing Assumptions

Real estate and infrastructure assets are not liquid and are not automatically rebalanced in the model. The forecasted real estate and infrastructure values do not fall outside of their respective tolerance ranges during the five year forecast.

INV.11.2 Basic Portfolio supporting Basic Claims Liabilities Rebalancing for 2019/20 and Thereafter

Starting in 2019/20, the Basic Claims, RSR and EFB portfolios have separate rebalancing rules. The portfolio supporting claims liabilities has similar rebalancing rules for the marketable bond portfolio.

- The dollar amount of the total fixed income portfolio is rebalanced to match the present value of Basic claims liabilities on an annual basis.
- The marketable bond duration is matched to the previous quarter's claims duration. Duration matching occurs in the first quarter of each fiscal year based on the claim duration at the previous fiscal year-end.
- Dollar matching rebalancing occurs in the model only once a year if the dollar difference between assets and liabilities exceeds +/- $20 million.

Figure INV- 34: Basic Claims Portfolio Asset Allocation

Line No.	Basic Claims Asset Allocation	Minimum	Target	Max
1	**Fixed Income**			
2	**Provincial Bonds**	50.0%	60.0%	70.0%
3	**Corporate Bonds**	15.0%	20.0%	25.0%
4	**MUSH**	15.0%	20.0%	25.0%
5	**Total Fixed Income**		**100.0%**	
6	**Public Equities**			
7	**Canadian Equities**		0.0%	
8	**Global Equities**		0.0%	
9	**Global Low Volatility**		0.0%	
10	**Total Equities**		**0.0%**	
11	**Alternatives**			
12	**Canadian Real Estate**		0.0%	
13	**Infrastructure**		0.0%	
14	**Total Alternatives**		**0.0%**	

Rebalancing

When dollar matching is required within the model, any surplus (or deficit) between the fixed income portfolio and claims liabilities is transferred to (or funded from) the liquid asset classes within the RSR portfolio. The allocation ratios are shown in the table below.

Figure INV- 35: Allocation Ratio

Line No.		Target Weight	Allocation Ratio
1	**Basic Line of Business Portfolio**		
2	**Government Bonds**	60.0%	75.0%
3	**Corporate Bonds**	20.0%	25.0%
4	**Total**	**80.0%**	**100.0%**
5	**RSR Asset Classes**		
6	**Government Bonds**	20.0%	30.8%
7	**Corporate Bonds**	10.0%	15.4%
8	**Canadian Equities**	12.0%	18.5%
9	**Global Equities**	13.0%	20.0%
10	**Global Low Volatility**	10.0%	15.4%
11	**Total**	**65.0%**	**100.0%**

To illustrate using a hypothetical $100 million dollar shortfall in Q1 between the fixed income portfolio and the claims liabilities. The model will transfer $30.8M, $15.4M, $18.5M, $20.0M and $15.4M from the government, corporate, Canadian equity, global equity and global low volatility asset classes, respectively. This money will be transferred into the government/corporate bond portfolios in a 75%/25% ratio.

INV.11.3 RSR and Employee Future Benefits Rebalancing Assumptions

The next two figures show the RSR and pension asset allocations. Note that the minimum and maximum allocations have not been approved in the Investment Policy Statement and are subject to change.

Figure INV- 36: RSR Asset Allocation

Line No.		Minimum	Target	Max
1	**Fixed Income**			
2	**Provincial Bonds**	10.0%	20.0%	30.0%
3	**Corporate Bonds**	5.0%	10.0%	15.0%
4	**MUSH**	0.0%	5.0%	10.0%
	Private Debt	0.0%	15.0%	20.0%
5	**Total Fixed Income**	**40.0%**	**50.0%**	**60.0%**
6	**Public Equities**			
7	**Canadian Equities**	9.0%	12.0%	15.0%
8	**Global Equities**	10.0%	13.0%	16.0%
9	**Global Low Volatility**	7.0%	10.0%	13.0%
10	**Total Equities**	**25.0%**	**35.0%**	**45.0%**
11	**Alternatives**			
12	**Canadian Real Estate**	7.0%	10.0%	13.0%
13	**Infrastructure**	2.0%	5.0%	8.0%
14	**Total Alternatives**	**10.0%**	**15.0%**	**20.0%**

Figure INV- 37: Employee Future Benefits Asset Allocation

Line No.		Minimum	Target	Max
1	**Fixed Income**			
2	**Corporate Bonds**	10.0%	20.0%	30.0%
3	**Private Debt**	0.0%	20.0%	25.0%
4	**Total Fixed Income**	**30.0%**	**40.0%**	**50.0%**
5	**Public Equities**			
6	**Canadian Equities**	5.0%	10.0%	15.0%
7	**Global Equities**	13.0%	18.0%	23.0%
8	**Global Low Volatility**	4.0%	7.0%	10.0%
9	**Total Equities**	**25.0%**	**35.0%**	**45.0%**
10	**Alternatives**			
11	**Canadian Real Estate**	12.0%	15.0%	18.0%
12	**Infrastructure**	7.0%	10.0%	13.0%
13	**Total Alternatives**	**20.0%**	**25.0%**	**30.0%**

The rebalancing rules for the RSR and EFB are summarized below.

1. **Marketable Bonds (Provincial and Corporate Bonds)**

If Provincial and corporate bonds remain outside their tolerance ranges for two consecutive quarters, the asset class will be adjusted to the target weight in the following quarter. The total portfolio reallocation requirements will be sourced from or reallocated from the equities portfolio.

2. **Equities**

For Canadian equities, Global equities and Global Low Volatility, when the asset class remains outside the maximum or minimum allocation limit for two consecutive quarters, then the asset class will be adjusted to the target weight in the following quarter. Inflows or outflows required for rebalancing will come from marketable bonds.

3. **Illiquid Asset Classes (MUSH, Private Debt, Real Estate, Infrastructure)**

MUSH, private debt, real estate and infrastructure are illiquid and are not automatically rebalanced in the model. The forecasted MUSH, private debt, real estate and infrastructure values do not fall outside of their respective tolerance ranges during the five year forecast period.

INV.12 COMPARISON OF FORECAST

This section compares this year's forecast to last year's forecast.

Figure INV- 38 provides detailed investment income information from the 2019 GRA interest rate forecast scenario. *Figure INV- 39* provides information from the 2018 GRA as presented in the 2018 Investment Income INV.11. *Figure INV- 40* compares the difference between *Figure INV- 38* and *Figure INV- 39*.

INV.12.1 Explanation of Major Differences in 2017/18 Actual vs. Forecast

Last year (2017/18), total Basic MPI investment income was forecasted to be $101.8 million. Actual investment income for 2017/18 was $116.3 million, which was $14.5 million higher than forecast. This difference can be primarily attributed to higher than expected real estate pooled fund returns. See the previous figure for the detailed breakdown – highlights are provided below.

- Total capital gains/losses for marketable bonds were slightly higher than forecast by $4.6 million.
- Canadian and U.S. equity investment income from dividends and realized gains were $0.8 million higher than forecasted.
- Realized gains on Canadian and U.S. equities were $8.8 million lower than forecasted in 2017/18. The S&P/TSX Composite index return was 3.2% in 2016/17 compared to the forecasted return of 7.2%. The U.S. equity return was 4.2% in CAD compared to the U.S. equity forecasted return of 7.2%.
- Real estate investment income was $12.7 million higher than forecasted. This variance was driven by a 12.4% return in the real estate pooled fund in 2017/18 compared to the forecasted return of 6.2%
- Infrastructure investment income was $0.7 million lower than forecast.

INV.12.2 Explanation of Major Differences between 2019 GRA and 2018 GRA Forecasted Years (2018/19 to 2021/22)

Long Term Bond Income

- There will be a larger dollar amount in fixed income assets compared to last year's forecast once the ALM is fully implemented in 2019/20. As a result, long term interest income is forecasted to be $18.5M higher on average from 2019/20 to 2021/22 compared to last year's forecast.

Marketable Bonds Gains and Losses

- A naive forecast was used in this year's rate application and last year's application, so there is no difference in gain/loss over the forecasted years.

Canadian and U.S. Equities

- After ALM implementation in 2019/20, dividends are forecasted to be lower on average by $10.9M compared to last year's forecast due to lower invested assets in equities.
- For 2019/20 and thereafter, realized gains are forecasted to be lower on average by $11.5M due to lower invested assets in equities and a zero percent turnover assumption for equities after the separation of assets occurs.

Other

- Management fees are forecasted to be lower after separation of assets into unique portfolios since there will be significantly less growth assets in the Basic line of business portfolio compared to last year's forecast.
- Pension transfer is zero in 2019/20 and subsequent years because income earned on employee future benefit assets have been separated into a unique portfolio and are calculated independently of the Basic claims portfolio.
- There is a significant difference in bond amortization this year versus last year. Separation of assets at the end of Q4 2018/19 causes the entire provincial and corporate bond portfolios to turn over at market value. Bonds are subsequently repurchased at the new market value.

INV.13 CHANGES TO THE INVESTMENT INCOME MODEL

Based on the requirements listed above, the model's investment portfolio is separated into 5 categories, these are:

1. Basic
2. Basic RSR
3. Extension
4. SRE
5. EFB

The following three asset classes have been added to the model:

1. Corporate Bonds
2. Global Low Volatility Equities
3. Private Debt

The following two asset classes have been renamed within the model:

1. Government bonds has been renamed to Provincial bonds
2. US Equities has been renamed to Global Equities

Further detail on Financial Model changes is available in *Part VIII Financial Forecasting Model*.

INV.14 INTEREST RATE FORECASTS AND CPI FORECAST DETAIL

This section shows detail on the interest rate forecasts and the CPI forecast. For the naive interest rate forecast used in the 2019 rate application, see *Figure INV-3* for the 10 year GoC bond yield, the marketable bond yield, MUSH yield and claims discount rate.

INV.14.1 Interest Rate Forecast

The naïve interest rate forecast is based on the February 28, 2018 Government of Canada 10 year bond yield, which was 2.24%. This naïve interest rate of 2.24% is used throughout the entire five year forecast for the 2019 GRA.

For information, Pro forma financial statements using the 50/50 and SIRF interest rate forecast are shown in *INV Appendix 10*.

The 50/50 forecast is based on the average between the naïve and SIRF forecast for each forecasted quarter. The methodology for SIRF is the same as last year. The short-term (years 1-2) interest rate forecast includes forecasts that are updated monthly. Conference Board of Canada (CBOC) and Laurentian do not provide monthly updated forecasts and are not included in the list.

Short Term (Years 1-2)

1. BMO, Average Period
2. CIBC, End of Period
3. RBC, End of Period
4. Scotia, End of Period
5. TD, End of Period

6. Global Insight, Average Period

7. Desjardins, End of Period

8. National Bank, End of Period

Long Term (Years 3-5)

The long-term (years 3-5) forecasters are taken from the short-term forecaster list. Three forecasts from the short-term forecast were not included. BMO and RBC's long term forecasts are not used because they prohibit public disclosure. Scotia was rejected because their forecast is not updated regularly on a quarterly basis.

INV.16 ASSET LIABILITY MANAGEMENT (ALM) PROGRAM

INV.16.1 Background on ALM Program

MPI uses duration and dollar matching, referred to as the ALM program, in order to manage the interest rate risk associated with MPI's assets and liabilities. Section 8.4 of MPI's Investment Policy Statement (*INV Appendix 1*) states the following:

> *"Interest rate risk is managed by matching the combined duration of the marketable bonds, which includes floating rate notes, with the actuarially determined duration of the Corporation's claims liabilities."*

Reducing interest rate risk has been a focus of MPI since 2014.

- In 2014, the duration bandwidth was changed from +/- 2.0 years to +/- 1.0 year. This reduction was an intermediate step designed to reduce the interest rate, forecasting, and rate-setting risks of MPI until the ALM Study was completed.
- In 2015, the ALM Study from Aon was completed, and the fixed income portfolio duration was fully matched to the corporate claims liability duration.
- In late 2017, the ALM Study from Mercer was completed, which recommended the separation of the commingled investment portfolio into five unique portfolios that back the corporation's liabilities and surplus. By the end of Q4 2018/19, Basic claims liabilities will be supported by 100% fixed income assets. This will significantly reduce the interest rate risk in the Basic line of business.
- In 2018, the duration of the marketable bond portfolio (i.e. excluding MUSH bonds) will be matched to the duration of the claims liabilities. This change is due to the change in the calculation methodology for the claims discount rate, which is now based upon the dollar weighted yield of the fixed income portfolio rather than the duration weighted yield of the fixed income portfolio. The net result is that the duration of the marketable bond portfolio will decrease by approximately 2 years. This transition to a lower duration marketable bond portfolio is forecasted to occur at the end of Q1 2018/19 in the new financial model.

INV.16.2 Interest Rate Risk Definitions

Interest rate risk, for the purpose of this application, is the net impact of changes in interest rates on claims liabilities and the gain or loss for marketable bonds. Interest rate risk can be shown on a Basic basis, as in *INV.16.2.1* and *INV.16.2.2*.

Interest rate forecasting risk, for the purpose of this application, is the uncertainty related to setting premium rates based on forecasted interest rates rather than future actual interest rates and the impact of the difference between the two.

14	Net Interest Rate Impact										
15	(1) Marketable Bond Gain/Loss	(19.4)	85.6	(52.5)	(18.8)	4.6	-	-	-	-	-
16	(2) Claims Interest Rate Impact	(26.1)	122.4	(76.2)	(9.0)	(15.8)	(8.2)	8.6	11.5	10.1	10.1
17	Net Impact of Changes in Interest Rates [(1) - (2)]	6.7	(36.8)	23.7	9.0	75.6	8.2	(8.6)	(11.5)	(10.1)	(10.1)

The net impact of changes in interest rates is on average ($10.1 million) per year with the naive forecast. The net impact decline in 2019/20 to 2022/23 is primarily due to the declining MUSH yield and declining allocation to MUSH bonds. MUSH yield declines from 4.57% at the beginning of the forecast period to 4.28% by the end of the

forecast period as older higher yielding MUSH bonds mature. Further, MUSH falls from 21.0% of the total portfolio as of February 2018 to 12.2% of the total Basic Line of Business portfolio as of Q4 2022/23. Both of these factors negatively impact the claims discount rate and the present value of the claims liabilities with no offsetting impact from the fixed income portfolio.

INV.16.2.2 Reduction in Basic Interest Rate Risk from Last Year

Interest rate risk is significantly reduced by creating a unique asset allocation for Basic Claims. To illustrate, for each year from 2019/20 to 2021/22, the Government of Canada 10 year bond rate was increased by 100 basis points on the last day of each fiscal year. The figure below shows the net impact from the basic line of business in the 2019 GRA compared to the 2018 GRA (found in 2018 GRA response to PUB(MPI) 1-43). The decrease in interest rate risk from the changes made as a result of the ALM study is significant. On average the net impact in the 2019 GRA was ($0.3M) compared to $35.6M in the 2018 GRA.

Figure INV- 48 +100 Bps GoC 10 Year Bond Comparison from 2019 GRA to 2018 GRA

Line No.		2019/20	2020/21	2021/22

2	Marketable Bond G/L	(113.0)	(117.1)	(120.1)
3	Claims Interest Rate Impact	(145.9)	(153.0)	(158.2)
4	Net Impact	32.9	35.9	38.1
5	**2019 GRA**			
6	Marketable Bond G/L	(131.6)	(144.5)	(154.8)
7	Claims Interest Rate Impact	(134.1)	(142.2)	(153.8)
8	Net Impact	2.5	(2.3)	(1.0)

INV.16.3 Historical Fixed Income Duration and Claims Duration

The table below shows the quarterly fixed income duration and the quarterly claim liability duration communicated to the bond manager each month to maintain a duration matching strategy in compliance with MPI's ALM program.

Figure INV- 49: Fixed Income Duration and Claims Duration

Line No.	Date	Fixed Income Duration	Claims Duration*	Difference (Fixed Income Duration - Claims Duration)
1	May-16	9.96	9.89	0.07
2	Aug-16	10.12	10.27	-0.15
3	Nov-16	10.18	10.23	-0.05
4	Feb-17	9.81	9.73	0.08
5	May-17	9.97	9.94	0.03
6	Aug-17	9.92	9.96	-0.04
7	Nov-17	10.06	9.92	0.14
8	Feb-18	9.72	9.68	0.04

9 * Claims Duration is one month lagged

INV.17 INVESTMENT POLICY STATEMENT

The Investment Policy Statement is reviewed on an annual basis (at a minimum). The policy was last updated on April 30, 2018. Revisions to the Investment Policy Statement to reflect decisions related to implementing the ALM plan will be brought to the Investment Committee at its next scheduled meeting on July 31, 2018. The MPI Board of Directors will consider recommendations of the Investment Committee the following week. It is anticipated that the revised Investment Policy Statement will be provided as part of the answers to the first round of Information Requests.

The Investment Policy Statement and associated governance documents attached to this application are current to the time of filing and material changes to the current Investment Policy Statement from the documents previously filed are explained below.

Fixed Income Portfolio (Section 8.4)

For interest rate risk management purposes the duration of the marketable bond portfolio (excluding MUSH bonds) will be matched to the duration of the claims liabilities.

Rationale: This change is required because of the change in the calculation methodology of the claims discount rate (from duration weighted to dollar weighted) as discussed in INV.16.1.

Minimum Credit Rating (Section 8.6)

The minimum credit rating was changed from “A (low)” to “BBB”.

Rationale: To conform to the standard definition of Investment Grade securities. This change was approved at the December 8, 2017 Investment Committee meeting.

INV.18 INVESTMENT RETURN COMPARISON (MFR 2019 GRA C.5)

Minimum Filing Requirement (MFR) 2018-1

Please provide a 5-year comparison of the Corporation's total annual investment return rates with the corresponding annual return rates of:

a) the Workers' Compensation Board (WCB),

b) the Teachers' Retirement Allowances Fund (TRAF),

c) the Civil Service Superannuation Board of Manitoba (CSSB),

d) Insurance Corporation of British Columbia (ICBC), and

e) Saskatchewan Government Insurance- Saskatchewan Auto Fund (SGI),

and please provide commentary on any significant differences.

Response:

SGI and ICBC's fiscal 2017 returns have not yet been published. MPI will provide those returns when they are available.

The following table shows the returns of WCB, TRAF, CSSB and MPI for the last five calendar years.

Figure INV- 50: Return Comparison

Line No.	Year	CSSB	TRAF	WCB	Average	MPI
1	**2013**	14.7%	14.0%	13.6%	14.1%	8.0%
2	**2014**	9.2%	10.8%	10.0%	10.0%	9.6%
3	**2015**	7.6%	8.3%	7.9%	7.9%	2.7%
4	**2016**	5.7%	7.3%	3.5%	5.5%	6.5%
5	**2017**	10.8%	9.2%	8.3%	9.4%	6.3%
6	**Annualized Return over 5 Years**	9.6%	9.9%	8.6%	9.4%	6.6%
7	**MPI Value Added**	-3.0%	-3.3%	-2.0%	-2.8%	
8	**Asset Allocation Adjusted Returns**					
9	**2016**	4.2%	5.5%	2.4%	4.0%	6.5%
10	**2017**	6.4%	6.5%	4.9%	5.9%	6.3%
11	**MPI Value Added (Asset Allocation Adjusted Returns)**					
12	**2016**	2.3%	1.0%	4.1%	2.5%	
13	**2017**	-0.1%	-0.2%	1.4%	0.4%	

MPI underperformed the average returns for CSSB, TRAF and WCB in 2017 by 3.1%, and underperformed by 2.8% over the full five year period. However, the asset allocation of these funds is very different than the asset allocation of MPI's fund as these funds have much larger allocations to growth assets. In order to make a direct and accurate comparison the asset allocations of the funds were adjusted so that they are on the same basis.

When the asset allocations of other funds were adjusted to match MPI's, their average return fell to 4.0% in 2016 and 5.9% in 2017, underperforming MPI by 2.5% and 0.4%, respectively. MPI does not have detailed returns by asset class for the other funds for the full five year period so it is not possible to provide adjusted returns prior to 2016.

The most relevant performance comparison is to MPI's custom benchmark and peer universe, both of which are calculated by Ellement Consulting and reflect MPI's asset allocation. In 2017 MPI outperformed the custom benchmark by 0.3% and the custom peer universe by 1.4%. See *INV Appendix 10* for the comparison of MPI's fiscal year asset class returns relative to their respective benchmarks.

INV.19 BASIC CLAIMS, RSR AND EMPLOYEE FUTURE BENEFITS PORTFOLIO INFORMATION

The investment income and asset allocation for Basic Claims, RSR and Employee Future Benefits for 2019/20 to 2022/23 is located in this section.

APPENDIX A - DEFINITIONS 55

Purpose

The purpose of this Policy is to provide comprehensive guidelines to the Investment Committee on considerations to be made in dealing with the Corporation's investments.

Effective Date

The Investment Policy Statement applies to investment activity on or after April 27~~30~~, 201~~7~~8.

Review

To be reviewed annually by the Investment Committee. The next scheduled review will occur in April 201~~8~~9. The Investment Committee will be required to provide a written report on the results of its review, including assessment of the effectiveness of this Policy and recommendations for revisions.

Approval

The Investment Committee of the Board authorizes Management to recommend approval to the Minister of Finance.

General Policy Statement

The purpose of the Fund is to pay the liabilities of the Corporation as they come due and to provide investment income from interest, dividends and capital gains that will assist in minimizing premiums payable by policyholders, in that order.

The Corporation must maintain significant long and short-term investment funds (the "Fund") to ensure satisfaction of its obligations to claimants. These assets must be managed in a manner which will maximize return while minimizing risk in an overall portfolio context. The Fund must also have sufficient liquidity to address all funding needs of the Corporation as they arise.

Total Return includes both the change in the price of a financial asset, over a set period of time, as well as any income or dividends paid by the asset. In a portfolio context, it is the weighted average of the change in price of the various asset classes.

Risk is the uncertainty of future outcomes. In a portfolio context, there is unsystematic risk which can be diversified away and systematic risk which cannot be eliminated. Systematic risk is essentially the risk inherent in securities markets. The minimum acceptable level of risk for the Corporation occurs when its assets have been sufficiently diversified so as to effectively eliminate unsystematic risk. Systematic risk may be controlled by investing in authorized asset classes and through the use of hedging strategies.

The Corporation considers the short-term volatility of premiums to be a primary concern. As such, mitigating short-term changes in the relative value of assets and liabilities is a major investment objective, particularly those generated by interest rates variations. The mismatch in the changes in assets and liabilities, as a result of changes in interest rates, is expected to be minimized by defining a narrow bandwidth around the actuarially determined duration of the Corporation's claim liabilities.

It is a statutory requirement that the Corporation, pursuant to the requirements of the Act, pay to the Minister of Finance (the "Minister"), all moneys in any reserves established under Section 18 of the Act and such additional moneys as are not immediately required for the purposes of the Corporation as are available for investment. The moneys paid will be invested in accordance with *The Financial Administration Act.* The Minister has charged the Department of Finance (the "Department") with the operational management of the Fund.

Any investment counsel, advisors or custodians that may be required to advise on the Corporation's investments will be engaged on a basis satisfactory to the Minister where applicable, subject to authorization by the Lieutenant Governor in Council.

The Minister and the Department recognize the need for participation and direction from the Corporation in determining the appropriate policies and strategies and parameters for investment of the Fund including the use of derivatives to mitigate investment risk or create a desired return (where no margin or borrowing is used). Derivatives are not to be used for speculative purposes.

The Investment Committee Working Group prepares an annual work plan for the Investment Fund and annually reviews the Investment Policy Statement. The Corporation also reviews the duties of the Board, the Investment Committee and the joint Working Group (the **"**Investment Committee Working Group" or "Working Group"), which is comprised of representatives of the Department and the Corporation.

Statement of Investment Beliefs

The administrators of the Fund believe that:

i. Asset allocation is the most important factor in determining the performance of the Fund.

ii. Market timing at the strategic asset allocation level is generally not an effective strategy for consistently increasing returns.

iii. Identifying, measuring and monitoring risks within the portfolio are important.

iv. The success of active management varies on the efficiency of capital markets.

   a. In inefficient markets, active managers can add value net of fees over the long term.

   b. In efficient markets, it is believed that active managers will tend to underperform net of fees over the long term.

v. Passive management may be appropriate to reduce active management risk and cost in both efficient and some inefficient markets.

vi. A liability sensitive approach to investing reduces the Fund's interest rate risk by matching the size and duration of the Corporation's liabilities with fixed income securities.

vii. Over the long-term, equities are expected to provide a return premium over bonds, with higher expected volatility.

viii. MUSH bonds benefit the Corporation without degrading the quality and return of the Fund's investment portfolio, while also benefiting Manitoba residents.

ix. Alternative asset classes such as real estate and infrastructure provide income and potential capital growth, and are suited to offset inflation sensitive liabilities.

x. Cash provides the lowest expected long-term return, and should be held in minimal amounts where possible.

Investment Fund Strategy Statement

The asset allocation contained in the Investment Policy Statement shall be adopted for investments of the Fund.

Equities

Equities include securities from Canada and the U.S.

The Working Group shall annually review the risk, return and diversification of the equity holdings in the Fund, and will report the results to the Investment Committee.

Alternative Investments

Alternative Investments include Canadian Real Estate, Private Equity and Infrastructure.

The Working Group shall annually review the risk, return and diversification of the Canadian Real Estate, Private Equity and Infrastructure holdings in the Fund, and will report the results to the Investment Committee.

Fixed Income

The Working Group shall annually review the risk, return and diversification of the fixed income holdings in the Fund, and will report the results to the Investment Committee.

The Fund's fixed income assets shall be primarily managed in a "buy and hold" strategy subject to changes in the duration of the claims liabilities. When it is advantageous, the Department may trade bonds to take advantage of various bonds that appear undervalued and to take advantage of the changing shape of the yield curve. The Department should

not be taking significant actions based on views regarding the future direction of interest rates. Fixed income management will be governed by the accepted duration ranges as defined in section 8.4 of this Investment Policy Statement. The fixed income portfolio shall be diversified amongst federal, Manitoba, other provincial, municipal and corporate issues and also amongst a variety of maturities.

Gains and Losses

The Corporation will account for gains and losses in accordance with International Financial Reporting Standards (IFRS).

Section I – Overview

1.1 This Investment Policy Statement ("the Statement") applies to the assets held in the Fund ("the Fund") in respect of the liabilities of the Manitoba Public Insurance Corporation ("the Corporation") under the Manitoba Public Insurance Corporation Act ("the Act"). The Statement contains investment objectives, investment guidelines, and monitoring procedures.

1.2 The Fund will be managed in accordance with all applicable legal requirements notwithstanding any indication to the contrary which might be construed from the Statement. The purpose of the Fund is to pay the liabilities of the Corporation as they come due and to provide investment income from interest, dividends and capital gains that will assist in minimizing premiums payable by policyholders, in that order.

1.3 With respect to any portion of the Fund invested in pooled funds, provisions of the Investment Policy Statement of such pooled fund shall prevail over those of the Statement to the extent that they are in conflict.

1.4 Any investment counsel or other agent or advisor providing services in connection with the investment of the Fund shall accept and adhere to this Statement.

Section II – Responsibilities

2.1 The purpose of the Investment Committee ("the Committee"), as appointed by the Board of Directors of the Corporation ("the Board") shall be to assist the Board in:

i) recommending investment policies and strategies to the Board for subsequent consideration by the Minister;

ii) review matters relating to investment activities of the Fund;

iii) providing oversight and monitoring performance of the Fund;

iv) monitor the implementation of investment decisions consistent with policies and strategies approved by the Board and the Minister through direction to the joint working group (the "Working Group") established between the Department of Finance (the "Department") and the Corporation; and

v) provide suggestions for consideration by the Working Group.

2.2 In accordance with the Section 12 of the Act, The Minister of Finance is responsible for the investments of the Corporation. Specifically, the Act provides:

INVESTMENTS
12(1) The corporation shall pay to the minister charged with the administration of The Financial Administration Act, for investment for the corporation, moneys in any reserve established under section 18 and such additional moneys as are not immediately required for the purposes of the corporation and are available for investment.

MONEYS TO BE CREDITED TO CORPORATION
12(2) Moneys paid under subsection (1) for investment shall form part of the trust and special division of the Consolidated Fund and may be invested in accordance with The Financial Administration Act, and the interest earnings thereon shall be credited to the account of the corporation in the trust and special division of the Consolidated Fund.

PAYMENT OF EARNINGS
12(3) Any earnings, whether alone or with the principal sum invested for the corporation under this section, or any part thereof, shall be paid over to the corporation by the minister charged with the administration of The Financial Administration Act on the request of the corporation."

RESERVES

18 The corporation shall establish and maintain reserves in such amounts that, at all times, it has sufficient funds to meet all the payments as may come payable under this Act and regulations.

2.3 Investment counsels, advisers and custodians may be hired by the Minister of Finance subject to authorization by the Lieutenant Governor in Council under The Executive Government Organization Act, Section 16 and 16(d) as follows:

AGREEMENTS WITH OTHER AUTHORITIES

16 The Lieutenant Governor in Council may authorize a minister, for and on behalf of the government, or an agency of the government, to enter into an agreement with

(d) any person or group of persons; for the benefit or purposes of the residents of Manitoba or any part thereof."

The Department is charged by the Minister with the operational management of the fund. Duties include establishing legal contracts with investment counsel, providing the Corporation with short term cash and treasury management services, managing the fixed income portfolio and providing input into the Investment Committee Working Group.

The Investment Committee Working Group is a joint committee of the Department and the Corporation. The role of the Investment Committee Working Group is:

a) Act as liaison between the Department and the Investment Committee;

b) Develop strategies for investment exposure for consideration by the Investment Committee and the Department;

c) Support the Assistant Deputy Minister in reviewing, screening and selecting investment managers;

d) Monitor performance of investment managers;

e) Prepare draft investment policies and annual strategies and draft parameters for the Fund for review and approval by the Investment Committee and the Department;

f) Implement investment policies and direction with the prior approval and concurrence of the Department;

g) Provide regular reports to the Investment Committee and the Department, as they shall require.

MPI's Financial Services Department manages the treasury function of the Corporation in conjunction with the Department of Finance. This department is also responsible for all the accounting requirements of the Fund.

MPI's Investment Department monitors the outside investment counsel for compliance with the Statement and their contracts, works with any outside

consultant for investment counsel searches, provides research and analysis on issues discussed by the Working Group, and develops and maintains relationships with members of the investment community and other provincial Crown insurance companies.

Section III – Conflict of Interest

3.1 A conflict of interest, whether actual, potential or perceived, is defined for the purposes of this Statement as any event in which the Corporation, an employee of the Corporation, an employee of the Department performing duties on behalf of the Corporation, any member of the Board or the Committee, any investment counsel or delegate, the Custodian, or any person or company directly related to any of the foregoing, may benefit materially from knowledge of, participation in, or by virtue of, an investment decision or holding of the Fund.

3.2 The Board shall satisfy itself that an appropriate policy regarding conflicts of interest exists and is followed by any investment counsel appointed. As a minimum, The Code of Ethics and The Standards of Professional Conduct adopted by the CFA Institute (formerly the Association of Investment Management Research or AIMR) shall be applied to such investment counsel.

3.3 A fiduciary, according to the CFA Institute, is one who holds a position of trust or confidence. A conflict of interest is deemed to exist when a fiduciary has an interest of sufficient substance and proximity to its duties and powers with respect to the Fund to impair its ability to render unbiased advice or to make unbiased decisions affecting the Fund.

3.4 A fiduciary, as described in section 3.3, must immediately disclose any conflict of interest in writing along with all relevant details to the chairperson of the Committee who, in turn, discloses it to all Committee members at the appropriate time.

3.5 No part of the Fund shall be loaned to any member of the Board, the Committee, an employee of the Department performing duties on behalf of the Corporation, or employee of the Corporation or any legal entity owned or controlled by any of the aforementioned. In addition, the Fund may not enter into a transaction with a related party unless:

a. The transaction is required for the operation or administration of the Fund and the terms and conditions of the transaction are not less favourable to the Fund than market terms and conditions; or
b. The securities of the related party are acquired through a public exchange, with the exception of MUSH bonds as noted in section 6.5.

Related party includes any officer, director or employee of the Corporation. It also includes the investment counsels and their employees, a union representing employees of the Corporation, a spouse or child of the persons named previously, or a corporation that is directly or indirectly controlled by the persons named previously, among others.

Section IV – Liability Characteristics

4.1 The Corporation is a Manitoba Crown Corporation and is not subject to provincial or federal income taxes.

4.2 The Corporation's liabilities include both short-term and long-term liabilities arising from its insurance business as well as pension liabilities. In its insurance business, short-term liabilities are a result of all perils coverage, which have a short time frame between claim reporting and claim settlement while long-term liabilities are a result of both PIPP coverage and tort coverage. The long-term nature of PIPP coverage arises mainly from lifetime benefits payable to eligible claimants. Tort coverage has a long-term nature mainly due to long settlement periods, which is a result of the more complicated nature of these claims.

4.3 The Corporation's cash needs are significant due to the uncertainties in the timing and amount of claims payments. This is offset by the high certainty of future premium income.

4.4 Benefits of the Personal Injury Protection Plan (PIPP) paid by the Corporation are indexed to inflation through the Manitoba consumer price index.

4.5 The assets supporting the Corporation's liability for the employer's portion of the employee's pension liability are co-mingled with other investments.

4.6 The duration of current liabilities of the Corporation are reviewed and calculated annually by MPI's Pricing and Economics Department.

Section V – Investment Objectives

5.1 To meet the Corporation's liability commitments, both short-term and long-term.

5.2 To maximize investment returns for an appropriate level of risk. Risk can be defined by the standard deviation of returns, the Sharpe Ratio, Value at Risk and other commonly used risk measures for the total MPI portfolio, or any component of the total portfolio, which are compared to the same measures for the relevant index. For more specific information on risk tolerances please see "Schedule B" of the relevant equity manager's contract.

5.3 Risk is also defined as the duration gap (or mismatch) between fixed income assets and claims liabilities. Duration is a measure of the sensitivity of the market value of fixed income assets and liabilities to changes in interest rates. Section 8.4 describes the duration bandwidth that the Corporation applies to manage its interest rate risk.

5.4 To have investment returns minimize premiums payable by policyholders.

5.5 To protect the portfolio from loss of principal (book value).

5.6 To achieve a time weighted total return, before all investment management fees, at least equal to the following indices and according to the target allocation defined in section 7.1. Passive management strategies are not expected to earn a return above their respective benchmarks. The investment returns achieved by the investment managers will be measured and monitored on rolling four-year and ten-year periods.

Asset Class	Annual Expected Return
Cash and Short-term	FTSE TMX 91-Day Treasury Bill Index
Canadian Bonds	
Fixed Income Portfolio	
Marketable Bonds	
Non-marketable Bonds	Return on the present value of the Corporations claim liability cash flows over the measurement period
Canadian Equities	
Large Market Capitalization Equities	S&P/TSX Capped Composite Total Return Index plus 150 basis points over a rolling four year period annualized
Small to Mid Market Capitalization Equities	BMO Small Cap (Unweighted) Blended Index plus 150 basis points over a rolling four year period annualized[a]
U.S. Equities	
Large Capitalization Equities	Russell 1000 Value Total Return Index
Small Capitalization Equities	Russell 2000 Value Total Return Index
Alternative Investments	
Canadian Real Estate	ICREIM/IPD Canadian Property Index
Infrastructure	CPI + 5%

[a] The unweighted index is an equally weighted average of the price of each member. The Blended index includes both equities and income trusts.

Section VI – Permitted Investments

6.1 The Investment Committee supports the Fund's annual commitment to new Manitoba School, Hospital and Municipal bonds and debentures. The Fund's annual commitment will be determined by the Department and reported to the Investment Committee.

6.2 The Investment Committee is committed to support Manitoba enterprise where, on the advice of the Minister of Finance, no degradation in investment yield or grade is evident. This mandate reflects the Investment Committee's commitment for the Fund investments to be socially responsible to Manitoba residents. The benchmark against which no degradation in yield or grade is allowed is defined as the ten-year Government of Canada bond at the time of the investment.

6.3 After meeting the commitments of 6.1 and 6.2, the Fund may only be invested in the following asset categories:

a) cash;

b) demand or term deposits, or similar instruments issued or unconditionally guaranteed by trust companies or banks;

c) short-term notes;

d) treasury bills;

e) bankers' acceptances;

f) commercial paper;

g) bonds and debentures or other debt instruments of government, government agencies, or corporations;

h) Canadian and U.S. publicly traded equities;

i) private equity and venture capital

j) real estate

k) infrastructure

l) pooled funds consisting of assets listed in a) through k) above.

6.4 Short-term investments include cash and fixed income investments having a maturity of less than one year at the time of purchase.

6.5 Bonds include all fixed income securities having a maturity of one year or more at the time of purchase and include Canada, Manitoba, provincial, municipal, corporate bonds, floating rate notes, and debentures that are tradable in the fixed income market and Manitoba rural municipality, school division and health care facility bonds and debentures (MUSH bonds) which are not tradable in the fixed income market.

6.6 Canadian equities include securities traded on the TSX or common stocks, preferred stocks and convertible securities of Canadian issuers.

6.7 U.S. equities include common stocks, preferred stocks and convertible securities of U.S. issuers.

6.8 Canadian Real Estate includes pooled funds and direct holdings of real estate.

6.9 Infrastructure includes pooled funds, segregated funds, direct holdings and co-investments.

6.10 Private Equity is an investment in an unlisted company, which is typically long-term and unregulated. Venture capital is a form of private equity which focuses on small to medium sized business with strong growth potential. Venture capital is designed to help entrepreneurs start up or develop a new business where a high degree of risk is involved. The Corporation has capped its investments in Private Equity and will make no new investments in this asset class.

6.11 The Fund may purchase derivative financial, commodity or currency related instruments such as forward contracts, options, futures or swaps provided that such participation is not for speculative purposes and are not purchased with the use of leverage. Use of derivatives should be consistent with the overall asset allocation and risk management of the Corporation. Use of a derivative is permitted only after the Working Group has reviewed the application of the derivative and determined that it meets or exceeds the defined investment objectives of this document. Derivative strategies also require the prior approval of the Committee.

6.12 Investment counsels shall not borrow money, pledge or otherwise encumber any of the Fund's assets except to the extent that a temporary overdraft may occur in the normal course of day to day portfolio management. The use of leverage associated with real estate pooled funds and infrastructure investments is acceptable and will be defined in the investment manager's contract.

6.13 The Investment Counsel shall assess the financial strength of borrowers by reference to published credit ratings and by their own analysis. The investment counsel's analysis should include all material factors relevant to assess the ability of the borrower to repay the debt instrument, to discharge interest obligations on the specified payment dates and to survive periods of financial adversity. New investments may not be made in debt obligations that are in default of principal or interest.

6.14 The Minister may enter into a written agreement with the Custodian for securities lending provided that readily marketable securities having a market value of at least 105%, of the market value of the securities lent, are maintained on at least a daily basis.

6.15 Investment counsels may use soft dollars (directed commissions) to pay for research related goods and services in accordance with the CFA Institute Soft Dollar Standards. Investment counsels shall disclose to the Corporation at least annually the total amount of commissions and the products and services obtained through soft dollar arrangements from the Corporation's account.

Section VII – Asset Allocation

7.1 The Fund's target asset allocation is the following:

Asset Class (Group)	Minimum	Normal	Maximum	Accounting Class**
Cash and short-term	0.0%	0.0%	5.0%	AFS
Fixed Income				
-Government Bonds	40.0%	45.0%	60.0%	FVTPL
-Corporate Bonds	0.0%	5.0%	10.0%	FVTPL
-Non-Marketable Bonds	15.0%	20.0%	25.0%	HTM
Total Debt	**60.0%**	**70.0%**	**80.0%**	
Public Equities				
-Canadian	7.0%	10.0%	13.0%	AFS
-U.S.	3.0%	5.0%	7.0%	AFS
Total Public Equities	**10.0%**	**15.0%**	**20.0%**	
Alternative Investments				
-Canadian Real Estate	7.0%	10.0%	13.0%	FVTPL
-Private Equity*	0.0%	0.0%	0.5%	AFS
-Infrastructure	2.0%	5.0%	8.0%	FVTPL
Total Alternative Investments	**9.0%**	**15.0%**	**21.5%**	

*represents net committed capital

**AFS – Available for Sale, HTM – Held to Maturity, FVTPL – Fair Value Through Profit and Loss.

7.2 The target asset allocation has been determined in order to meet Fund objectives. It reflects a risk/return tradeoff that was selected by the Committee.

7.3 The Working Group, at its discretion, can allocate up to 20.0% from the Canadian equity asset class to the Canadian Small to Mid Cap equity asset class.

7.4 The Working Group, at its discretion, can allocate up to 30.0% from the U.S. equity asset class to the U.S. Small to Mid Cap equity asset class.

7.5 The target allocation to illiquid growth assets (Real Estate and Infrastructure) as a proportion of total growth assets (Canadian and U.S. equity, Real Estate and Infrastructure) should not exceed 50%.

7.6 The actual allocation to MUSH bonds should not exceed 25% of the total fund.

7.7 The Working Group will monitor the target asset allocation of the fund on a quarterly basis, at a minimum, and rebalance if necessary in accordance with the Working Group's rebalancing policy.

7.8 Securities held in a pooled fund are classified on the basis of the assets comprising the major portion of such pooled funds.

7.9 Derivative instruments along with any collateral held thereon are included in the asset class comprising the securities whose return or price serves as the basis for the pricing of such derivative instruments.

Section VIII – Investment Risk

8.1 Diversification between asset classes is provided through the asset allocation guidelines set forth in the Statement.

8.2 Diversification within each asset class is provided by limiting to 5% or less the percentage of the book value of Fund assets invested in a single security not issued or guaranteed by the Government of Canada, charged against the Consolidated Revenue Fund, issued by a Canadian province or a guarantee of a Canadian province. Minimum and/or maximum percentage weight targets may be developed and implemented for corporate and provincial bond issuers (Province of Manitoba excluded) to assist in the diversification of the fixed income portfolio.

8.3 Diversification in equity investments is achieved by contracting with investment counsels that concentrate on specific equity market segments (large cap and small/mid cap) as well as investment style (value, growth and core). Managers will be selected based on their investment philosophy and internal investment policies.

8.4 Interest rate risk is managed by matching the duration of the fixed income portfolio, which includes marketable bonds~~,~~ and floating rate notes~~, and non-marketable bonds~~ to the actuarially determined duration of the Corporation's claims liabilities. If an allocation to floating rate notes is designated by the Working Group to fund other asset classes, then the designated amount can be excluded from the duration calculation.

8.5 When the Corporation invests outside of Canada to gain exposure to the relevant market, the Corporation will consider limiting its exposure to foreign exchange risk by hedging.

8.6 Quality is ensured by requiring that 100% of the market value of short-term securities have a minimum credit rating of R-1 (low) as assigned by Dominion Bond Rating Service Limited (DBRS), or its equivalent, and that 100% of other fixed income securities have a minimum credit rating of BBB~~A~~ (low), or its equivalent, as assigned by Standard & Poor's or Moody's Investors Service, or is a security issued or guaranteed by the Government of Canada, charged against the

Consolidated Revenue Fund, issued by a Canadian province or a guarantee of a Canadian province. If a security has a split credit rating from the credit rating agencies the lower rating will be accepted.

8.7 In the event of a downgrade in the credit rating of a fixed income security by a recognized bond rating agency to a credit rating below the minimum as defined in Section 8.6, the Fixed Income Manager will follow the course of action set out below:

a) The Working Group will be notified of the downgrade at the earliest possible opportunity;

b) Within five business days of the downgrade, the Investment Counsel will advise the Working Group in writing of the course of action taken or to be taken by the Investment Counsel along with the rationales; and

c) The Investment Counsel will provide regular reporting to the Working Group on the status of the asset until such time as it matures, is sold, or is upgraded to a rating consistent with the minimum rating standards as defined in Section 8.6.

8.8 Trading and execution of the Fund will be done through the investment counsels who shall utilize their best efforts to obtain best execution of orders at the most favorable prices and competitive commission rates.

Section IX – Voting Rights

9.1 The responsibility of exercising and directing voting rights acquired through Fund investments is delegated to the investment counsels, who shall at all times act prudently and in the best interests of the Fund.

9.2 In case of doubt as to the best interests of the Fund, the investment counsel must request instructions from the Working Group and act in accordance with such instructions.

9.3 Investment counsels shall maintain a record of how Fund voting rights have been exercised.

9.4 Investment counsels shall advise the Working Group and provide details when:

a) the results of the vote are contrary to the investment counsel's recommendations;

b) the vote is related to anti-takeover charter and bylaw amendments or shareholder rights;

c) the voting rights have not been exercised.

9.5 Investment counsels shall not delegate voting rights unless the policy and procedures to be used when voting has been filed with the Minister of Finance and written approval of those policies and procedures have been granted.

Section X – Monitoring

10.1 Each quarter, investment counsels shall provide a letter indicating compliance with the Statement and the investment counsel's mandate and indicating all instances where the Statement and mandate were violated.

10.2 At the end of each quarter, the market value of each Fund investment is calculated. Investments that are not regularly traded are valued by the Custodian according to a methodology acceptable to the Committee. Any such investment that may represent more than 1% of the market value of the Fund is valued by a qualified independent appraiser or by the Committee through a resolution at least every three (3) years, except for non-marketable bonds as they are reported at book value.

10.3 Fund performance is evaluated at least quarterly in accordance with current Performance Presentation Standards established by the CFA Institute. Such evaluation is focused on objectives set in this document for the Fund and for the investment counsels.

10.4 Investment counsels report to the Minister of Finance and the Committee at least annually in order to:

a) provide information concerning new developments affecting the firm and its services;

b) review the transactions in the latest period and the assets held at the end of the period and explain how they relate to the strategy advocated;

c) explain the latest performance;

d) provide an economic outlook along with a strategy under such circumstances.

10.5 The following indices should be utilized for performance comparison purposes:

Asset Class	Comparative Benchmark
Cash and Short-term Bonds	FTSE/TMX 91-Day Treasury Bill Index
Fixed Income Portfolio	
Marketable Bonds Non-Marketable Bonds	Return on the present value of the Corporations claim liability cash flows over the measurement period
Canadian Equities	
Large Capitalization Equities	S&P/TSX Capped Composite Total Return Index
Small to Mid Capitalization Equities	BMO Small Cap (Unweighted) Blended Index[b]
U.S. Equities	
Large Capitalization Equities	Russell 1000 Value Total Return Index
Small Capitalization Equities	Russell 2000 Value Total Return Index
Alternative Investments	
Canadian Real Estate	ICREIM/IPD Canadian Property Index
Infrastructure	CPI + 5%

b The unweighted index is an equally weighted average of the price of each member. The Blended index includes both equities and income trusts

10.6 The Corporation has a graduated investment manager compliance policy in accordance with this Investment Policy Statement with escalating action based upon the degree of non-compliance. The Corporation monitors the compliance of its active equity managers with their internal Investment Policy Statements on a monthly basis and reports to the Investment Committee Working Group on a quarterly basis. In addition, the Corporation evaluates the compliance with the defined duration bandwidth as defined in Section 8.4 on a monthly basis and reports to the Working Group on a quarterly basis.

COMPLIANCE RULES:

1. Maximum concentration in an individual holding
2. Sector weight limits (linked to index)

3. Market capitalization limits (min & max)
4. Minimum and maximum number of holdings
5. Cash restrictions:
    a. Less than 10% of each managers portfolio
    b. Holdings rated A1 or better
    c. Short-term (less than 1 year)

DEFINITIONS:

Non-compliance is defined as minor if the manager is less than 10% out of compliance, for compliance rules 1, 2, 3 and 5(c). All breaches of compliance rules 4, 5(a) and 5(b) are considered major.

ACTION:

For minor instances of non-compliance the relevant external manager is notified of the non-compliance with the Investment Policy Statement. For major issues of non-compliance the relevant manager is contacted and requested to rectify the non-compliance within 30 days. Minor issues of non-compliance will be addressed internally by the Corporation. Major issues of non-compliance will be brought to the attention of the Investment Committee Working Group at its next meeting.

REPORTING

All major and minor cases of non-compliance with the Investment Policy Statement, and any related action taken, will be reported to the Investment Committee and the Investment Committee Working Group. Compliance reports will be completed at the end of each calendar month by the Investment Department.

The Investment Committee Working Group has the authority to provide exemptions to these rules and will report to the Investment Committee whenever it exercises this authority.

Section XI – Withdrawal Policy

11.1 In order to support the financial health of the Fund, ensure necessary liquidity levels are maintained and adequate diversification by asset class and by manager is adhered to, the Corporation has established the following guidelines for cash withdrawals.

11.2 Withdrawals of corporate funds to fund corporate operations are permissible, provided that pension plan assets are not affected by the withdrawals. Cash management is the joint responsibility of the Investment Department and the Risk Control and Financial Forecasting Department. The withdrawals will be reported to the Investment Committee Working Group at the Committee's next scheduled meeting. Withdrawals shall be reported to the Investment Committee at the Committee's next scheduled meeting.

11.3 The cash withdrawal guidelines are intended to assist in managing the Fund and maintaining adherence to the target policy weights, to the extent possible. The dollar amount of each withdrawal will be calculated by the Risk Control and Financial Forecasting Department and implemented by the Investment Department, which shall exercise judgment in withdrawing cash based on the following factors:

1. withdrawals are to be from retained earnings only, which represent corporate assets;
2. the market value of the fixed income portfolio (excluding cash) must match (or exceed) the present value of the claim liabilities;
3. withdrawals from each asset class/ manager will be in order of greatest variance from the target, until the withdrawal amount is satisfied;
4. each asset class must remain within its min/max range as established in Section 7.1;
5. availability of liquidity within the portfolio;
6. current market conditions; and
7. future Fund strategies, and Corporate needs.

11.4 In order to reduce cost, the number of asset classes/managers involved in the transaction should be the fewest possible to raise the necessary amount. Illiquid asset classes such as real estate, infrastructure and private equity are generally exempt from normal course withdrawals.

11.5 The Working Group is required to advise the Investment Committee of any exceptions to this policy and state the reason(s) for the exception (s).

Section XII – Review

12.1 This Statement may be changed or modified at any time by action of the Committee of the Corporation in consultation with the Minister of Finance.

12.2 This Statement shall be reviewed at least annually. Such review may be caused by:

a) a fundamental change in the business of the Corporation;

b) significant revisions to the expected long-term trade-off between risk and reward on key asset classes;

c) a major change in liabilities;

d) a significant shift in the financial risk tolerance of the Corporation;

e) shortcomings of the Statement that emerge in its practical application, or substantive modifications that are recommended to the Committee by a investment counsel;

f) applicable change in legislation.

Appendix A - Definitions

Alternative Asset Classes:
There are three primary asset classes: equities, bonds, and cash. Alternative asset classes refer to any other types of investments or collections of investment strategies that can be used to diversify investment portfolios. These investment strategies are generally aimed to provide meaningful growth, low correlation and lower volatility with equity markets. Some examples of alternative investments include: hedge funds, private equity, private debt, currencies, commodities, infrastructure and real estate.

Duration:
Duration is the weighted average time until the repayment of a fixed income instrument. In addition, it is also used to measure the price sensitivity of those instruments to changes in bond yields.

Fixed Income Securities:
An investment that provides a return in the form of fixed periodic payments and the return of the principal at maturity. Unlike a variable-income security, the payment amounts and dates of a fixed-income security are known in advance.

Investment Counsel:
Investment counsels are appointed by the Province of Manitoba to invest certain funds of the Corporation in accordance with and subject to the terms of an agreement with the Provincial government.

MUSH Bonds:
MUSH bonds are Manitoba rural municipality, school division and health-care facility bonds which are not tradable in the fixed income market and are managed by the Department of Finance at the Province of Manitoba.

Operational Asset Liability Management Policy

ICWG Policy #1
Effective April 13, 2018~~March 21, 2017~~

I. Background

The Corporation uses duration matching in order to manage the interest rate risk of the Corporation. Section 8.4 of MPI's Investment Policy Statement states the following:

"Interest rate risk is managed by matching the duration of the fixed income portfolio, which includes marketable bonds and floating rate notes to the actuarially determined duration of the Corporation's claims liabilities. If an allocation to floating rate notes is designated by the Working Group to fund other asset classes, then the designated amount can be excluded from the duration calculation.~~*"Interest rate risk is managed by matching the duration of the fixed income portfolio, which includes marketable bonds, floating rate notes, and non-marketable bonds to the actuarially determined duration of the Corporation's claims liabilities. If an allocation to floating rate notes is designated by the Working Group to fund other asset classes, then the designated amount can be excluded from the duration calculation."*~~
"

Interest rate risk is the risk of economic loss resulting from market changes in interest rates and the impact on interest rate sensitive assets and liabilities. Interest rate risk arises due to the volatility and uncertainty of future interest rates.

II. Objective

In order to minimize the Corporation's interest rate risk, the duration matching portfolio will closely match the claims liabilities in both dollar amount and duration.

III. Definitions

The duration matching portfolio includes marketable bonds and floating rate notes~~ non-marketable bonds (MUSH bonds).~~.

The present value and duration of the claims liabilities will be determined by the actuarial department.

IV. Dollar Matching

The market value of the duration matching portfolio for the current month shall be maintained by the fixed income manager within +/- $100 million of the present value of the claims liabilities at the previous month-end unless another value is provided by the ICWG.

V. Duration

The fixed income manager is to match the duration of the duration matching portfolio to the duration of claims liabilities as per Section 8.4 of the Investment Policy Statement. In practice it is difficult to maintain a 0.0 year duration gap when matching fixed income assets

to claims liabilities. Therefore, the duration of duration matching portfolio shall be maintained by the fixed income manager within +/- 0.25 years of the duration of the claims liabilities.

The claims duration target for the fixed income manager for the current quarter will be based on the duration of the claims liabilities at the end of the previous fiscal quarter unless another duration target is provided by the ICWG. The fixed income manager will have until the end of the current fiscal quarter to reach the new duration target.

VI. Measurement

Modified duration will be used to determine the duration of the duration matching portfolio unless effective duration is a more appropriate measure.

The claims liability duration will be updated by the actuarial department on a monthly basis using the latest discount rate including the Margin for Adverse Deviation (MfAD)/Provision for Adverse Deviation (PfAD).

VII. Reporting

The duration and present value of the claims liability will be communicated to the fixed income manager (DOF) on a monthly basis.

The duration gap and dollar gap between the duration matching portfolio and the claims liabilities will be reported to the Investment Committee and Investment Committee Working Group every fiscal quarter.

VIII. Review

This policy will be reviewed by the ICWG annually in conjunction with the annual review of the IPS. This Policy may be changed or modified at any time by action of the ICWG.

If there is an inconsistency between this policy and MPI's IPS, then the terms of the IPS shall prevail. Further, nothing in this policy shall override or neutralize MPI's obligation to comply with all applicable legislation.

Rebalancing Policy
ICWG Policy #2
Effective April 13, 2018~~March 21, 2017~~

The Investment Committee Working Group (Working Group) has the responsibility to rebalance the portfolio according to the asset class weights outlined in the Investment Policy Statement (IPS).

The asset class rebalancing ranges, as defined in Section 7.1 of the IPS, are as follows:

Asset Class Group	Minimum	Target	Maximum
Cash and short-term	0.0%	0.0%	5.0%
Fixed Income			
Government Bonds	40.0%	45.0%	60.0%
Corporate Bonds	0.0%	5.0%	10.0%
Non-Marketable Bonds	15.0%	20.0%	25.0%
Total Debt	60.0%	70.0%	80.0%
Public Equities			
Canadian	7.0%	10.0%	13.0%
U.S.	3.0%	5.0%	7.0%
Total Public Equities	10.0%	15.0%	20.0%
Alternative Investments			
Canadian Real Estate	7.0%	10.0%	15.0%
Private Equity*	0.0%	0.0%	0.5%
Infrastructure	2.0%	5.0%	8.0%
Total Alternative Investments	9.0%	15.0%	21.5%

*represents net committed capital

The Working Group will monitor the target asset allocation of the fund, at a minimum, on a fiscal quarterly basis.

Whenever an asset class is outside of its target range, it will be reported to the Investment Committee during the Investment Activity and Performance Report. If the weight of any asset class falls outside the allowable range, then that asset class will be rebalanced back into the target range for that asset class within six (6) months.

If the Working Group wishes to maintain an asset class outside of its specified minimum-maximum range for more than six months it must report the reasons for such variance to the Investment Committee and seek the Committee's approval. The Investment Committee may approve an asset class to remain outside of the rebalancing range for a limited period of time, to be defined by the Working Group at the time of the request, after the initial six (6) month period.

Alternative asset classes, which includes real estate, private equity and infrastructure, can be highly illiquid and costly to rebalance. Therefore, special consideration will be given to

rebalancing alternative asset classes. These asset classes will be rebalanced on a best efforts basis based upon available liquidity in the relevant fund and the liquidity policy of the relevant fund.

This policy will be reviewed by the ICWG annually in conjunction with the annual review of the IPS.

If there is an inconsistency between this policy and MPI's IPS, then the terms of the IPS shall prevail. Further, nothing in this policy shall override or neutralize MPI's obligation to comply with all applicable legislation.

Equity Manager Monitoring and Termination Policy
ICWG Policy #3
Effective April 13, 2018~~March 27, 2017~~

I. Policy Objectives and Manager Expectations

The decision to retain or terminate an investment manager can be a difficult and subjective process. Retaining an unskilled manager that consistently underperforms the benchmark or terminating a skilled manager that underperformed only in the short term can have a detrimental effect on the returns of the fund. The purpose of this policy is to provide a systematic framework for equity manager retention, monitoring and termination.

This policy is intended to act as an operational guideline for the Investment Committee Working Group (ICWG). The process outlined in this policy takes into account both qualitative and quantitative factors to ensure that such decisions are made fairly and as objectively as possible when evaluating managers.

The guidelines in this document apply to all public equity portfolios and are designed to:

i. Foster a long-term approach to manager evaluations that is forward looking.
ii. Provide a systematic quantitative and qualitative framework to assess the factors relevant to future performance.
iii. Improve client/manager communication by informing each manager of the standards by which they will be evaluated and the consequences of failing to meet these standards.
iv. Promote timely and appropriate responses to actual and potential performance issues.

This policy will be reviewed by the ICWG annually in conjunction with the annual review of the Investment Policy Statement (IPS). If there is an inconsistency between this policy and the IPS, then the terms of the IPS shall prevail. Further, nothing in this policy shall negate MPI's obligation to comply with all applicable legislation.

Active Equity Manager Expectations

Active managers may have a value or growth investment style that may occasionally fall out of favour for a period of time. Therefore, active managers, especially those managers that have high conviction in their process, can be expected to underperform from time to time over the short term as their style goes out of favour. However, over the long term, active equity managers must add value net of fees over their contractual benchmark index in order to justify their higher fees relative to a passive strategy.

Passive Manager Expectations

Passive equity managers are expected to have minimal tracking error relative to the contractual benchmark, and to match the benchmark's return gross of fees.

II. Monitoring

The IPS states (page 5) that all asset classes will be reviewed on an annual basis. A written report will be prepared for all equity managers on an annual basis, at minimum, that will analyze the return and risk of the managers and discuss any major organizational changes within the firm. For additional oversight, a portfolio summary report will be prepared on a monthly basis and will be sent to the Investment Committee Working Group to provide equity manager investment return updates.

Watchlist Status
If an equity manager is not meeting performance expectations, or has undergone change(s) that may affect its performance going forward, the manager may be placed on "Watchlist" status. The purpose of placing a manager on the Watchlist is twofold. First, the action communicates to the manager the ICWG's concern about any issues. Second, the ICWG will begin a process to formally evaluate the continued retention of the investment manager. Placing a manager on the Watchlist is an intermediate step toward either resolving the problem or terminating the manager.

The ICWG may place an equity manager on Watchlist status at its discretion at any time. An active equity manager will be automatically placed on the Watchlist if the manager meets any one of the following qualitative or quantitative factors:

Qualitative

a. A change in ownership, or a change in the CEO, CIO or relevant portfolio manager
b. Change to an investment manager's philosophy or process it uses to implement the investment mandate;
c. Material litigation or fraud allegations involving the investment manager;
d. Significant account losses of more than 25%, or account growth of more than 50% within the most recent 12 month period available.

Quantitative:

a. Active equity manager underperforms the contractual benchmark net of fees over four years.

Equity managers will typically remain on Watchlist status for qualitative reasons for one year to ensure that outstanding issues have been resolved. When the manager is placed on Watchlist status, the Watchlist Timeline will be used for guidance.

Watchlist Timeline

Initial Annual Review

1. Calculate the manager's annualized performance (including absolute, relative, risk adjusted and other risk measures) over the most recent four year period and since inception and compare the manager's performance to their benchmark;
2. If the manager falls short of expectations and is placed on the Watchlist:
    a. the manager will be formally notified, a copy of this policy will be provided to the manager for added transparency, and the ICWG will seek an explanation from the manager;
    b. A written report with the reasons why the manager was placed on Watchlist status will be provided to the Investment Committee.

12 Month Review

3. The ICWG will re-evaluate the manager's performance to determine if it has improved over the most recent 12 month period;
4. If the manager's underperformance is ongoing and material, or if there continues to be concern about the organization, the manager will remain on Watchlist status;
5. The manager will be notified of the result. If the manager remains on the Watchlist, the manager will be requested to present to the ICWG to discuss what action the manager plans to take to address their underperformance;
6. A written report will be provided to the Investment Committee that recommends either removing the manager from the Watchlist, or keeping the manager on the Watchlist.

18 Months (if required)

7. The ICWG will re-evaluate the manager's performance and any ongoing organization issues;
8. If the issue(s) have not improved, the manager will remain on Watchlist status;
9. A portion of the manager's assets under management may be removed;
10. A written report will be provided to the Investment Committee that recommends either removing the manager from the Watchlist, or keeping the manager on the Watchlist.

24 months (if required)

11. Re-evaluate the manager's performance;
12. If the ICWG has:
    a. lost confidence in the manager, and performance has not improved, the ICWG may recommend in a written report to the Investment Committee that the manager be terminated;
    b. confidence in the manager, the ICWG will recommend to the Investment Committee in a written report to keep the manager on the Watchlist.
        i. the manager will be reviewed on an ongoing semi-annual basis until the issue is resolved. A written report will be provided to the Investment Committee at each subsequent six month interval that recommends either removing the manager from the Watchlist, or keeping the manager on the Watchlist.

This process can be accelerated if the manager's performance deteriorates materially, if the manger makes significant organizational changes, experiences sizable

redemptions or any other developments occur that cause the ICWG to lose confidence in the manager.

III. Termination

The following two broad questions are designed to help guide the decision to retain or terminate an equity manager:

1. Does the ICWG accept the manager's rationale for underperformance; and,
2. Does the ICWG have continued confidence in the manager's ability to outperform the benchmark?

This policy provides guidance to the ICWG in reviewing the performance of the equity managers. The active equity manager contracts allow the Department of Finance to terminate any manager, with or without cause, after 30 days notice, whether or not the manager is on the Watchlist.

Trading Approval Policy
ICWG Policy #4
Effective April 13, 2018

I. Objective

The Trading Approval Policy sets out authority for approving trading within the fund.

II. Definitions

Public market asset classes include government bonds, corporate bonds, Canadian equities and U.S. equities.

Private market asset classes include real estate, infrastructure, and private equity.

III. Types of Public Market Trading

This policy is to define authority regarding the following types of trading:

1. Rebalancing between asset managers;

2. Asset liability management (ALM) trading for controlling the duration of the fixed income assets or the dollar gap between fixed income assets & claim liabilities, or;

3. Reinvestment of equity dividends.

All external investment counsel for public market investments have discretion to make trades within their contracted mandate.

IV. Public Market Trading Authority

All public market trading must be approved by either 1) the Investment Committee Working Group (ICWG), or 2) both MPI's Chief Financial Officer and the Assistant Deputy Minister from the Department of Finance, or their respective designates in their absence.

The Operational Asset Liability Management Policy requires dollar and duration matching to be completed on a monthly basis. Therefore, ALM trades required by this policy up to $50 million ($CAD) can be approved by the Chief Actuary (MPI) or MPI's Chief Financial Officer or their respective designates in their absence. In these cases, the Chief Actuary will notify MPI's Chief Financial Officer and the Assistant Deputy Minister from the Department of Finance.

Reinvestment of equity dividends can be approved by the Manager of Investments, up to $10 million dollars.

V. Private Market Trading Authority

All private market trading must be approved by either: 1) the ICWG, or 2) both MPI's Chief Financial Officer and the Assistant Deputy Minister from the Department of Finance, or their respective designates in their absence.

VI. Review

This policy will be reviewed by the ICWG annually in conjunction with the annual review of the Investment Policy Statement (IPS). This Policy may be changed or modified at any time by action of the ICWG.

If there is an inconsistency between this policy and MPI's IPS, then the terms of the IPS shall prevail. Further, nothing in this policy shall override or neutralize MPI's obligation to comply with all applicable legislation.

Agenda D.2
January 31, 2018

20. INVESTMENT COMMITTEE TERMS OF REFERENCE

Mandate

The Corporation recognizes that the Manitoba Public Insurance Act requires that the Minister of Finance (the "Minister") manage the Corporation's investment assets (the "Fund") and as such retains the ultimate responsibility for the prudent investment and management of the Fund. The Corporation also acknowledges that the Minister, as represented by the Department of Finance (the "Department") desires to work closely and cooperatively with the Corporation in ensuring that the Fund's investment strategies and policies address both the need and objectives of the Corporation and the Minister, respectively.

1. Composition of Committee

1.1 The Investment Committee will be comprised of at least three directors determined by the Board, provided that the Chair of the Board and in the Chair's absence, the Vice-Chair of the Board, shall be a member of the Investment Committee.

1.2 The Board shall fill vacancies, which arise from time to time to ensure the minimum membership is maintained and will appoint additional members to the Committee as required.

1.3 Any Board Member not assigned to the Committee is welcome to attend meetings in a non-voting capacity.

1.4 The Chief Financial Officer and Manager of Investments are required to attend meetings of the Committee.

2. Chair of Committee

2.1. The Chair and Vice-Chair of the Committee shall be appointed by the Board of the Corporation.

3. Governance of Committee

3.1. Meetings shall be held at the call of the Chair of the Committee or by the requisition of at least two members of the Committee, on not less than 72 hours' notice provided that at the sole determination of the Chair of the Committee, where exceptional circumstances warrant, a meeting of the Investment Committee may be held on less than 72 hours notice. Meetings of the Committee shall be held at least quarterly. Additional meetings may be held as deemed necessary.

3.2. A quorum for meetings shall be not less than a majority of the members of the Committee.

3.3. Decisions at meetings of the Committee shall be determined by a vote of the majority of those present and eligible to vote. The Chair of the meeting shall have a casting vote in the event of a tie.

3.4. The Corporate Secretary or their designate shall prepare and maintain minutes of each meeting.

4. Role of the Committee

4.1 The purpose of the Committee shall be to assist the Board of the Corporation in:

4.1.1 Recommending investment policies and strategies to the Board for subsequent consideration by the Minister of Finance;

4.1.2 Reviewing matters relating to investment activities of the Fund;

4.1.3 Providing oversight and monitoring performance of the Fund.

4.1.4 Monitor the implementation of investment decisions consistent with policies and strategies approved by the Board and the Minister through direction to the joint working group (the "Working Group") established between the Department of Finance (the "Department") and the Corporation.

4.1.5 Provide suggestions for consideration by the Working Group.

5. Role of the Department

5.1 The role of the Department has been determined by the Act and the Minister as follows:

5.1.1 Manage the investment of the Fund and implement investment direction and decisions consistent with approved investment policies and strategies;

5.1.2 Through participation on the Working Group, develop proposed investment policies and strategies and the parameters for the Fund for recommendation to the Board and approval by the Minister and;

5.1.3 Appoint up to three persons as representatives to the Working Group.

6. Role of the Working Group

6.1 The Working Group will be comprised of up to three persons appointed by the Department of Finance and the following MPI representatives:

- Vice President, Finance & Chief Financial Officer
- Corporate Controller

- Manager, Investments
- Manager, Risk Control & Financial Forecasting

The Vice President, Finance and CFO and the Assistant Deputy Minister of the Treasury Division of Finance will co-chair the Working Group.

6.2 The role of the Working Group is to:

6.2.1 Act as liaison between the Department and the Investment Committee;

6.2.2 Develop strategies for investment exposure for consideration by the Investment Committee and the Department;

6.2.3 Support the Assistant Deputy Minister in reviewing, screening and selecting investment managers;

6.2.4 Monitor performance of investment managers;

6.2.5 Prepare draft investment policies and annual strategies and draft parameters for the Fund for review by the Investment Committee and the Department;

6.2.6 Implement investment policies and direction; and

6.2.7 Provide regular reports to the Investment Committee and the Department, as they shall require.

7. Authority of the Committee

7.1 The Investment Committee shall make assessments and determinations and recommend investment policy to the Minister of Finance. The Investment Committee will establish the actual criteria and mechanisms for assessing the effectiveness of investment policy, including investment strategies and parameters. The Investment Committee shall have the authority to appoint representatives to the Working Group.

7.2 The Investment Committee will report to the next meeting of the Board of the Corporation.

7.3 The Investment Committee has specific and primary responsibility for the implementation of and adherence by the Corporation to the Investment Policy Statement.

These Terms of Reference are to be reviewed annually by the Investment Committee, and then, as part of the review of the Corporate Governance Manual, by the Governance & Human Resources Committee, followed by the Board.

3. Assess Interest Rate Risk Management Strategy 12

4. Address Phase One CAC Recommendations 19

1
MERITS OF UNIQUE ASSET ALLOCATIONS

5.02 (a) An analysis of the merits of adopting a unique asset allocation and Investment Policy Statement (i.e. segregating the assets) for each of the Corporation's three lines of business (Basic, Extension, SRE), excess capital/retained earnings/Rate Stabilization Reserve (RSR) and its pension assets.

BACKGROUND

Currently, MPI commingles the assets of the three lines of business (Basic, Extension and Special Risk Extension ("SRE")), the Rate Stabilization Reserve ("RSR") and its employee pension plan ("Pension") (together the "components"). Our analysis considers the advantages and disadvantages of the current commingled asset approach versus an approach that would segregate the assets of each component and develop a distinct asset allocation policy for each based on its goals and characteristics. Developing optimal asset allocation policies for each component does not preclude MPI from commingling certain components with similar goals and characteristics.

Reviewing whether each component is best served by common or separate asset mix policies is part of good due diligence. Mercer analysed and compared the liability characteristics of each component to assess whether there were sufficient similarities across components to support a common asset allocation policy. This analysis considered the appetite for risk that can be borne by MPI across the various components and other requirements such as liquidity needs.

In PUB Order No. 162/16 (December 15, 2016), Mr. Valter Viola made recommendations that are addressed in this study. Mr. Viola, in the submission, represented the Consumers' Association of Canada ("CAC"). Mr. Viola made the following recommendation #18:

"The interests of all relevant stakeholders should inform decisions regarding both the accounting for and management of the assets and liabilities related to the pension plan and other employee benefits. A desirable outcome is to have greater clarity around the appropriateness and prudence of maintaining different types of assets and liabilities commingled in one fund."

ANALYSIS

The primary distinguishing characteristic of the components are:

Item	Basic	Extension	SRE	RSR	Pension
Purpose	Pay Basic Claims	Pay Extension Claims	Pay SRE Claims	Stabilization of Insurance Rates	Pay Employee Pension Benefits
Investment Goals (from MPI Investment Policy Statement at April 27, 2017)	The purpose of the Fund is to pay the liabilities of the Corporation as they come due and to provide investment income from interest, dividends and capital gains that will assist in minimizing premiums payable by policyholders, in that order.				
Liquidity needs	Sufficient liquid assets for Basic claims	Sufficient liquid assets for Extension claims	Sufficient liquid assets for SRE claims	Sufficient liquid assets to dampen shocks in rates	Sufficient liquid assets for pension payments
Assets[1] ($ Millions at 02/28/2017)	$2,189	$134	$172	$99	$353
Sensitivity to Interest Rate Changes (Duration[2])	10.5[3]	1.1[3]	2.7[3]	0.0	15.6[4]
Sensitivity to Inflation Rate Changes (Duration[2])	10.4[3]	0.0[3]	0.0[3]	0.0	12.6[4]

1. Source: MPI Financial Statements as at Feb 28 2017.

2. Duration is a measure of interest rate sensitivity. A duration of 10 means a 1% decrease (increase) in the interest rate used to calculate the liability will result in a 10% increase (decrease) in the liability.

3. Based on MPI duration calculations including Provision for Adverse Deviation ("PfAD") and Internal Loss Expense Adjustment ("ILEA").

4. Based on financial statements' disclosures and additional sensitivity tests provided by the actuary.

Approach	Advantages	Disadvantages
❑ Comingled	• Single set of documentation and oversight. • Some cost savings and efficiencies.	• Investment performance of the comingled assets may not necessarily align with the component's liability/risk profile and may create unintended financial results when the component is examined in isolation. • Impractical to meet a common investment objective with a single asset allocation when components have significantly different sensitivities to interest rate and inflation changes.
☑ Unique **MERCER RECOMMENDED**	• A unique asset allocation for each component would permit the reflection of each component's: - Duration and liability/risk profile - Liquidity needs/constraints - Goals and objectives - Minimum return considerations • Investment performance of segregated assets could be accounted by component. • The assets for each line can be monitored and re-allocated, as needed • Investment managers' fees may still be calculated on aggregated assets. • Investment manager performance reviews can continue to be reviewed in aggregate	• Requires a significant change to MPI internal accounting system • Relatively minor charge for additional accounts from manager and custodian. • Increased documentation • Oversight and review of each component's asset allocation and performance could add to the review process.

IMPLEMENTATION CONSIDERATIONS

The conclusions and recommendations of the Asset Liability Study will help develop the rationale for changing the structure from a comingled asset basis to some degree of asset segregation. That is, the study may reveal that it is prudent to have some components comingled; whereas other components should be segregated.

Currently, the MPI internal accounting system is designed to accommodate a commingled asset approach. In order to more fully understand the implementation implications of segregating assets, MPI should investigate the following:

1. Board approval process to accommodate the transition.
2. Cost of elected transition. These costs should consider both internal and external costs (e.g., custodial, legal, audit)
3. Transition timeline that allows for sufficient time to develop and test the new accounting system and to obtain the appropriate level of input from external providers involved in the transition.

RECOMMENDATION

This preliminary review strongly supports the consideration of unique asset allocations by component for the following reasons:

1. Better alignment of the asset allocation policy with characteristics and needs of each component.
2. Better alignment with respective metrics to assist in accountability and pricing.
3. Better visibility of each component's portfolio while maintaining the ability to re-allocate assets between components, as each component's obligations evolve.

Once the Asset Liability Study is complete (November 30, 2017), the study will have provided the rationale on which components should be comingled. MPI should consider the implementation considerations noted above before it proceeds with the transition to the new structure.

2
MERITS OF NEW FIXED INCOME EXPOSURE

5.02 (b) Examine the merits of adding exposure to types of fixed income not currently included in the portfolio (e.g. mortgages, private debt, foreign debt, etc.).

BACKGROUND

Currently, MPI has a target weight of 70% to fixed income investments. Within this allocation, there is a 50% target weight to Marketable Bonds and a 20% target weight to Non-Marketable Bonds. MPI's current fixed income structure is dominated by Manitoba Schools ("MUSH") bonds and Non-Manitoba Provincial bonds. Approximately 4% resides in Federal and Corporate bonds. There is currently no allocation to real return bonds within the portfolio. There is currently no allocation outside of Canada.

The Canadian bond market is represented by the FTSE TMX Canada Universe Index. As at September 30, 2017, the Canadian bond market was composed of:

SECTOR	WEIGHT (%)
Federal	37.00
Provincial	33.71
Municipal	1.92
Corporate	27.37
Total	**100.00**

The decision to explore exposure to types of fixed income not currently included in the portfolio will be reviewed, as part of the Asset Liability Study commissioned in early October 2017. The review will consider the advantages and disadvantages of various fixed income asset classes and investment strategies.

REVIEWING FUNDAMENTAL OBJECTIVES

Given current bond yield levels and the uncertainty surrounding fixed income markets, there are valid reasons to question the key fundamental objectives that have traditionally lead investors toward fixed income:

- **For Capital Preservation:** The risk of negative returns over the short/medium term is perhaps higher than ever before (since yields are so low)
- **For Income and Real Return:** Given current yields and inflation expectations, it is difficult to foresee significant real returns from traditional core fixed income portfolios
- **For Liquidity:** While domestic government bond liquidity remains likely, many portfolios have migrated toward more active positions with higher allocations to corporate bonds
- **To Provide Hedge on Interest Rate Risk Exposure:** Fixed income represents a matching asset that aligns with the nature of liabilities (insurance, pension and other fixed liabilities).

It is good governance practice to take a step back and re-confirm investment strategy and the implementation approach to fixed income in consideration of the challenges and opportunities in the current market environment.

ASSET CLASSES TO CONSIDER

We believe the following types of liquid and illiquid products may have a valuable role to play as part of MPI's allocation and are worth modelling as part of the Asset Liability Study. However, the appropriateness of different strategies will depend on MPI's return objectives, risk tolerance, overlap with existing asset exposure, tolerance for illiquidity and complexity, desire for liability matching characteristics, and governance arrangements. Our discussion assumes that MPI's current objectives are as follows from the April 27, 2017 Investment Policy Statement: "The purpose of the Fund is to pay the liabilities of the Corporation as they come due and to provide investment income from interest, dividends and capital gains that will assist in minimizing premiums payable by policyholders, in that order.

To aid in assessing each option, we provide general guidance on the relative ability of each asset class to fulfil these objectives.

ASSET CLASS	ABILITY TO MATCH DURATION	ABILITY TO ENHANCE INVESTMENT RETURNS	ABILITY TO PROTECT PRINCIPAL
Federal/Provincial Bonds	Very strong. Diverse set of duration and terms to choose from.	Weak. Modest real return expectations at best.	Excellent, particularly for shorter-duration federal bonds.
Real Return Bonds	Strong for MPI's inflation linked liabilities.	Weak. Will only perform well if Canadian inflation is high.	Principal may erode as interest rates rise and/or inflation expectations change.
Private Debt (Investment Grade)	Modest. Limited issuances available.	Strong.	Weak. Interest rate sensitive.
Commercial Mortgages	Modest.	Modest	Moderate. Interest rate sensitive.
Levered Bonds (Generally 3 times exposure. Available for Canadian Long Bonds and RRBs)	Very Strong Capital efficient approach.	Depends on underlying bonds. RRBs have a greater ability than long bonds.	Weak. Interest rate sensitive.
Growth Fixed Income (includes Global Bonds, US High Yield, and Emerging Markets Debt)	Very Weak	Strong	Variable (vehicle dependent).

FEDERAL/PROVINCIAL BONDS

A diversified portfolio of nominal bonds issued by the Government of Canada and the Provinces constitutes 70% of the Canadian bond universe and forms the backbone of most institutional investors fixed income portfolios. Federal issues are extremely liquid, provide significant flexibility to match duration, and are of the highest quality. Provincial issues currently deliver higher returns than federal issues (with yields varying by credit quality of each province).

From our perspective, while real yields from federals and provincials are modest, we still believe that these bonds should form the foundation of a fixed income portfolio. A strong foundation allows investors to more confidently pursue excess returns in other areas of the sector.

REAL RETURN BONDS

Real Return Bonds ("RRBs") have the components of a conventional bond, coupon payments and return of principal at maturity. The distinguishing feature of the RRB is that both the periodic coupon payments and the return of principal at maturity are linked to the consumer price index ("CPI") over the respective term. The real yield (i.e., the yield in excess of CPI) is known at date of issue. The coupon payments and adjusted principal repayment depend on future inflation. This makes RRBs an explicit hedge against inflation risk.

The Canadian RRB market is fairly large and liquid. There are currently 15 outstanding issuances, among which eight were issued by the Government of Canada and 7 are provincial issuances.

RRBs are the most direct hedge to inflation, but provide no opportunity for additional real returns (except when used in an overlay approach where the long term credit spread between federal and provincial bonds is included). Investors looking to balance return enhancement with inflation hedging often look to obtain an implicit or indirect inflation hedge using real assets, which are expected to deliver inflation sensitive returns (e.g., physical[1] real estate, physical infrastructure).

PRIVATE DEBT

Private Debt (also known as Direct lending or Private Credit) is a broad term that refers to any investment in privately negotiated debt. Private debt is similar to a loan in that it is capital provided (as an investment) to an entity in exchange for interest (and possibly other payments) and the return of the original principal at a defined point in the future.

Private debt encompasses corporate debt, real estate debt, and infrastructure debt, as well as some opportunistic credit strategies. For each form of debt, exposure can be via senior loans or subordinated/mezzanine loans. Issuers may be investment grade, but on the whole, the private debt market is sub investment grade and similar in some regards to the syndicated/bank loan and high-yield markets, though typically with higher yields, additional return sources, and different market dynamics.

The debt is also not widely held, and is customized to the borrower's requirements, thus rendering it illiquid. We note that private debt investments have existed for a number of years, but were, for a long time, the preserve of a minority of investors, of which banks were the most significant. Today, private debt is an asset class increasingly considered by a broad range of institutional investors.

[1] Physical real estate investment means actually investing in a physical property that produces income and capital gains or losses. This should not be confused with real estate investments that invest in the stocks of real estate companies.

Borrowers often choose private debt financing because it can be customised to their specific needs or when public debt is not available to them. Given the illiquidity of the underlying asset, investors may choose to access private debt through their private market allocation.

The attractiveness of the private debt market is often linked to the aftermath of the global financial crisis, overleveraged banks, shrinking balance sheets, and the impact of international banking regulation on banks' lending activity. Although there's a positive tailwind from the changed market dynamics (particularly in Europe), we believe there's a strategic role for private debt in institutional portfolios. With the long-term nature of liabilities, pension funds and other institutional investors are in a position to offer liquidity to the market and thereby realize an illiquidity premium. Considering the attractive return potential of private debt, it's one manner in which investors can diversify from equities and yet maintain a similar level of expected return.

COMMERCIAL MORTGAGES

A commercial mortgage is a mortgage loan secured by commercial property, such as an office building, shopping centre, industrial warehouse, or apartment complex. The proceeds from a commercial mortgage are typically used to acquire, refinance, or redevelop commercial property.

Commercial mortgages are structured to meet the needs of the borrower and the lender and generally subject to extensive underwriting and due diligence prior to closing.

Canada's institutional commercial mortgage market has seen remarkable growth, keeping pace with the expansion of the directly held real estate sector. The player pool is also growing. Mortgage lending and investing has been dominated by chartered banks, credit unions and life insurance companies, but recently, non-bank mortgage lending companies have increased their market share.

In light of stable real estate market conditions, commercial mortgages should continue to serve as an effective alternative investment within Canadian institutional fixed income portfolios. Institutional investors have earned higher risk-adjusted spreads with minimal volatility. For investors seeking long-duration assets to meet long-tail liabilities, commercial mortgages can also offer better relative value than comparable fixed-income instruments with a similar duration. Added to these benefits is the higher degree of control investors exert over the structure and underlying credit risk of commercial mortgages versus corporate bonds, allowing investors to potentially manage the downside risk throughout the cycle.

OVERLAY BONDS

Implementing an interest rate hedging strategy does not always require a reduction in the allocation to return seeking assets, as it is possible to synthetically increase exposure to bonds through borrowing. Funding can be obtained through various mechanisms through the derivatives market. Pooled funds offering this type of strategy typically focus on the:

1. FTSE TMX Long Term Provincial Index (duration around 15 years) or

2. FTSE TMX Real Return Bond Index.

Canadian bond managers offer pooled funds that typically provide a 3 times leveraged approach (i.e., one dollar invested provides three dollars of exposure to the underlying bonds less borrowing costs).

By synthetically increasing exposure to bonds, investors can track liabilities in a capital efficient manner as market interest rates change.

Since funding costs are currently lower than the yield-to-maturity on the underlying bonds, a long bond overlay strategy comes with a positive expected return. In addition, an RRB overlay strategy normally includes a return enhancer equal to the long term spread between federal and provincial bonds. When all other assets are kept unchanged, adding a bond overlay strategy will typically increase the Plan's expected return.

GROWTH FIXED INCOME

We define Growth-oriented fixed income as fixed-income assets and strategies expected to generate returns in excess of government bonds and investment-grade credit, but do not have effective interest rate risk hedging properties when MPI liabilities are considered.

Growth Fixed Income generally refers to mandates that take long, strategic, and tactical positions in government bonds, corporate bonds, high yield, currencies and a number of other asset classes within developed and emerging markets. Approaches are generally unconstrained in approach and can allocate to areas of the global fixed income marketplace that a manager believes to be most attractive.

HIGH YIELD

High yield bonds refers to bonds that are rated below investment grade (i.e., have a credit rating that is lower than BBB- or equivalent). These bonds have a higher chance of failing than investment grade bonds and therefore are subject to more default risk. Although these bonds are publicly traded, they are generally less liquid than investment grade corporate bonds.

In terms of risk and return profile, High Yield falls between equity and investment grade bond investing. High yield bonds tend to outperform other fixed income assets in the recovery phase of the economic cycle, and should be expected to underperform when an economy moves into recession. Relative to equity investments, high yield bonds provide superior downside protection under negative economic scenarios. Over time we would expect the asset class will produce positive returns without adding excessive risk to a well-diversified portfolio.

High yield bond are typically issued by:

- Emerging companies raising capital for expansion

- More mature companies with relatively weak balance sheets
- Companies taking on debt for acquisitions or leveraged buyouts

The asset class has traditionally been centered in the US where the market remains more developed. The European market has made considerable progress over the last ten years and now represents around 20% of the global market. Mercer's preference is to pursue a global allocation within High yield bonds.

EMERGING MARKET DEBT

Emerging Market Debt ("EMD") generally refers to bonds issued by the governments of less developed countries. Debt can be issued in the currency of the country ("local currency") or in a "hard currency", historically US Dollars, but now also in the Euro and occasionally Japanese Yen.

The risk premium available to investors is the compensation for being exposed to credit risk and for the unhedged investor, currency (for debt denominated in local currency) risk.

Advantages of local-currency EMD:

- Appreciation of emerging market currencies as emerging market economies mature;
- A "deeper" market and a higher average credit quality;
- Structural real yield advantage ("positive carry").

However, emerging market countries are more vulnerable to crises with numerous examples of currency devaluations and inflation, so some investors may prefer the perceived security of hard-currency debt. As such, we can also see some advantages to appointing a manager who has expertise in both and allowing them discretion to set the local / hard allocation.

3

ASSESS INTEREST RATE RISK MANAGEMENT STRATEGY

5.02 (c) Study the Corporation's current interest rate risk management strategy (duration matching) relative to the alternatives (including a cash flow matching strategy and a hybrid/bucketed approach in respect of claim liabilities). Provide the pros and cons of changing our strategy, practical implementation issues to consider, etc.

BACKGROUND

MPI's business lines' (i.e., Basic, Extension and Special Risk Extension) liabilities and pension liabilities are sensitive to changes in interest rates, which is summarized as follows:

Item	Basic	Extension	SRE	RSR	Pension
Assets[1] ($ Millions at 02/28/2017)	$2,189	$134	$172	$99	$353
Sensitivity to Interest Rate Changes (Duration[2])	10.5[3]	1.1[3]	2.7[3]	0.0	15.6[4]
Sensitivity to Inflation Rate Changes (Duration[2])	10.4[3]	0.0[3]	0.0[3]	0.0	12.6[4]

Source: MPI Financial Statements as at Feb 28 2017.

2. Duration is a measure of interest rate sensitivity. A duration of 10 means a 1% decrease (increase) in the interest rate used to calculate the liability will result in a 10% increase (decrease) in the liability.

3. Based on MPI duration calculations including Provision for Adverse Deviation ("PfAD") and Internal Loss Expense Adjustment ("ILEA").

4. Based on financial statements' disclosures and additional sensitivity tests provided by the actuary.

Short-term volatility of premiums is a primary concern therefore mitigating short-term changes in the relative value of assets and liabilities is a major investment objective, particularly those generated by interest rates variations. As a result, MPI has historically maintained a well-structured approach to interest rate risk management.

MPI's current interest rate risk management policy is summarized as follows:

- Duration[2] matching fixed income portfolio strategy to closely match claims liabilities in both dollar amount and duration.
- Fixed income manager will have *market value* of duration matching portfolio within *+/- $100M* of the *present value of claims liabilities*[3] in the previous month end.
- Duration matching portfolio will be within +/- 0.25 years of claims liability duration including the Provision for Adverse Deviation ("PfAD").
- Claims liability duration is based on previous fiscal quarter.
- Modified duration used unless effective duration is a more appropriate measure.

Interest rate risk management can be categorized into 3 approaches:

1. Duration matching (i.e., matching bond and liabilities within a specified tolerance)
2. Cash flow matching (i.e., matching bond cash flows to claims/benefits cash flows)
3. Hybrid bucket matching (i.e., hybrid of 1. and 2.)

The decision to elect a particular interest rate risk management strategy will depend upon the impact of each approach on security, affordability and efficiency. Each of the three options have varying levels of precision to hedging interest rate risk. Analysis was conducted to develop reasonable rationale on the go forward approach.

In discussions with investment managers that have a significant number of P&C general asset mandates, we understand that most mandates are based on duration matching without dollar matching constraints. Some mandates are based on hybrid bucket matching. In rare cases, the mandate is to follow a cash flow matching approach. The reasons for not adopting a cash flow matching approach are 1. the liability cash flows are projected expectations and actual experience can be materially different, and 2. cash flow matching has an opportunity cost as matching cash flows takes priority over maximizing yield given credit rating, liquidity and concentration constraints.

---

[2] Duration is a measure of interest rate sensitivity. A duration of 10 means a 1% decrease (increase) in the interest rate used to calculate the liability will result in a 10% increase (decrease) in the liability.

[3] $1.9 Billion as at February 28, 2017. Source is MPI Financial Statements as at February 28, 2017.

On December 15, 2016 at a meeting of the Public Utilities Board, Mr. Valter Viola made recommendations, which are addressed in this study. Mr. Viola, in the submission, represented the Consumers' Association of Canada ("CAC"). Mr. Viola made the following recommendation #15:

"Effectiveness of Duration Policy: The effectiveness of the duration policy should be reviewed, given the inherent risks of changing real interest rates and unexpected inflation arising from MPI's liabilities, and exposure to changes in nominal interest rates in the MPI portfolio (i.e., nominal bonds without inflation protection). More specifically, MPI should re-assess the effectiveness of its duration-matching strategy since inflation (actual and/or expected) may differ from current expectations."

ANALYSIS

In general, there are 3 approaches that institutional investors use to manage interest rate risk, as summarized below:

Approach	Pros	Cons
Duration Matching	Cost effective approach. Protects against parallel shift in yield curve. Provides more flexibility with regard to investment vehicles, particularly if return enhancement is a priority.	Does not protect as well against non-parallel shifts in comparison to other approaches.
Cash Flow Matching	Higher resolution matching Protects against reinvestment risk, including non-parallel yield curve shifts	Precision of claims/benefits projections may not merit high resolution matching, as projected cash flows can be materially different from actual. Generally, most costly approach from return and fees trade-off viewpoint.
Hybrid/ Bucket Approach	Cheaper than cash flow match Some protection against non-parallel yield curve shifts	Less protection against interest rate risk than cash flow matching approach. In terms of return and fees trade off, in between duration matching and cash flow matching.

A hybrid/bucket approach combines the merits of duration matching (low cost effective matching of interest rate risk) with cashflow matching. It 'buckets' obligations into various tranches and builds an asset portfolio that has expected cashflows that are substantively similar to each 'bucket'. Relative to duration matching, it improves the robustness of the interest rate matching, but is not as precise as a cashflow matching approach.

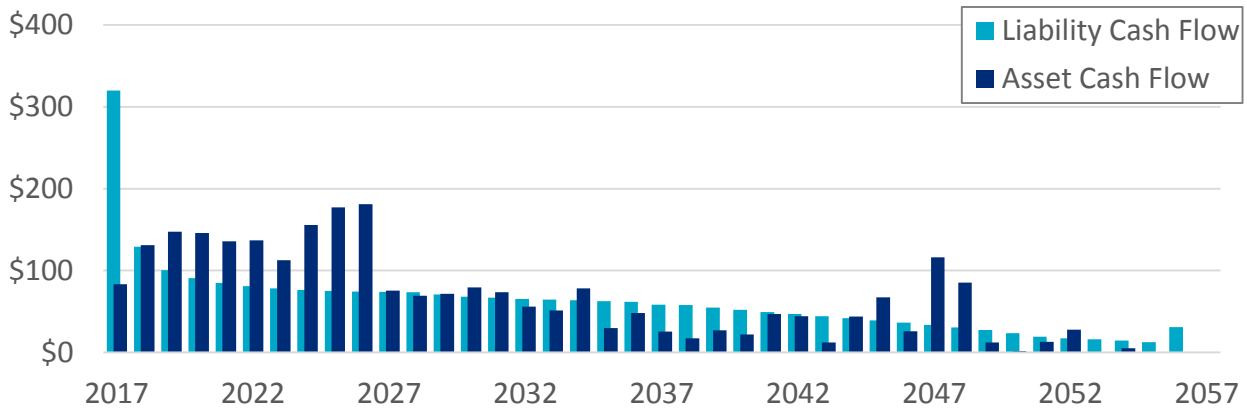
A hybrid/bucket approach is generally more costly to implement and administer than duration matching approaches, but has the added benefit of matching convexity risk more closely than duration matching. Convexity risk is the risk of non-parallel shifts in the yield curve and is most pronounced when unusual changes in yields happen. While we acknowledge that a hybrid/bucket approach more precisely immunizes convexity risk, we also observe that:

1. Convexity risk is generally equally likely to result in a gain or a loss to an investor, and
2. Gains/losses resulting from non-parallel shifts often works themselves out over modest periods of time.

For investors with very limited tolerance for risk over the short term and sufficient scale to warrant a sophisticated matching program, we support a hybrid/bucket approach and/or a cashflow matching approach. But for investors who can tolerate modest levels of risk over the short term and target excess returns from active management, we are comfortable recommending a duration matching approach which allows for more efficient implementation and a broader opportunity set.

PROJECTED CASHFLOWS: CURRENT ASSET ALLOCATION

Assuming future inflation will match the 2% annual target, the current interest rate risk management approach provides relatively good coverage of the expected claim payments. The following chart compares the expected liability cash flows (claim payments) to the cash flows from the current bond portfolio:

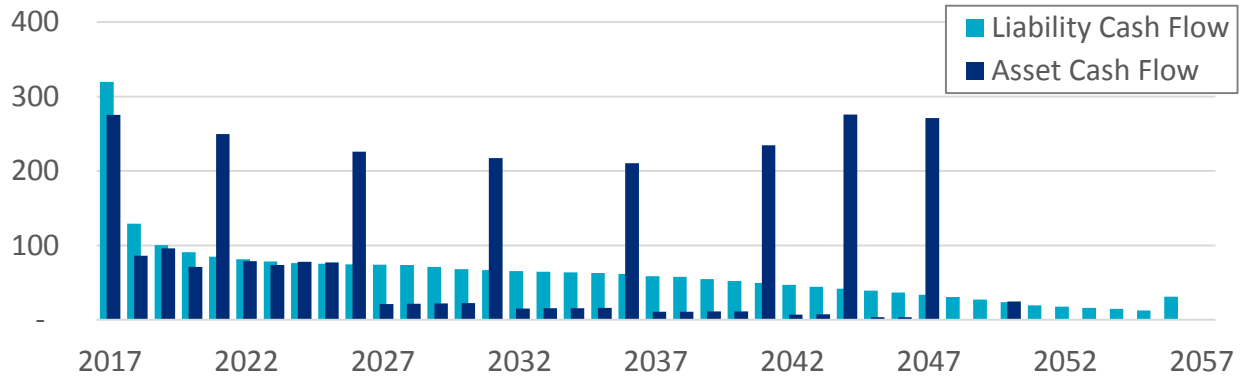


Dollars in millions.

THE CHALLENGES OF ELIMINATING INFLATION RISK

The current strategy exposes MPI to the risk of inflation increases in excess of 2% per annum. Unfortunately, it is virtually impossible to construct a portfolio that would match the expected claim payments in any future inflation scenario. This is in part due to the limited issuance of Real Return Bonds (RRBs). Although the RRB market is fairly large and liquid, there are currently only about 15 bonds. Eight were issued by the Government of Canada (good liquidity) and 7 are provincial bonds (poor liquidity). One could argue that the task of cash flow matching with RRBs could be made easier if the RRB bonds were stripped. (Stripping bonds is the process of breaking down a bond into individual coupons and a maturity payment). RRB stripping would allow for better matching as the breaking down the RRB bond into smaller pieces makes fitting the cash flows easier; however, RRB stripping is a rare occurrence as most investors prefer to buy the entire bond and pricing of the components can be very difficult given the unknown of actual inflation at various points in the future.

The following chart shows cash flows from a portfolio consisting of 34% nominal short and mid-term bonds and 66%[4] RRBs (roughly reflecting the discount rate and inflation sensitivity of the claim payments stream) compared to the expected liability cash flows. The chart illustrates the challenge of achieving inflation-sensitive cash flow matching due to the limited number of RRB issues and their specific maturity dates.



Dollars in millions.

IMPLEMENTATION CONSIDERATIONS

Given the circumstances outlined in the analysis, it is reasonable to take a measured approach to including RRBs rather than trying to hedge all of the inflation risk. Depending on whether MPI decides to assign the RRB mandate internally or externally the implementation approach may differ. If the mandate were handled externally, the most efficient and affordable approach would be to invest in a passively managed RRB fund or a levered RRB fund for better capital efficiency and return potential. If the mandate is managed internally, MPI's investment bond team could consider an RRB portfolio approach that would fit the liability cash flows better than the first method.

RECOMMENDATION

One of MPI's key investment objectives is to match interest rate risk:

> *Short-term volatility of premiums is a primary concern therefore mitigating short-term changes in the relative value of assets and liabilities is a major investment objective, particularly those generated by interest rates variations.*

[4] FTSE TMX RRB Index has a duration of about 15; whereas the MPI Basic liabilities have a real duration of about 10. This means a 66% RRB allocation would provide a real duration of 10 (i.e., 66% x 15 = 10).

MPI's current approach is a duration matching approach with a dollar matching constraint. From our perspective, Duration matching is the most cost effective and flexible approach to mitigating interest rate risk. Given MPI's willingness to accept modest levels of credit and liquidity risk, we recommend continuing with duration matching. While cash flow matching, or a hybrid/bucketed approach may be more precise, the incremental costs and complexity ought to be considered carefully, since often times the convexity risk (which these approaches help mitigate) tend to work themselves out naturally over time.

4

ADDRESS PHASE ONE[5] CAC RECOMMENDATIONS

5.03 (h) Address the recommendations made by the Consumer's Association of Canada (CAC) as per Schedule G of the RFP. The following eight (8) recommendations shall be addressed in Phase One:

5. Risk/Return Definitions for Asset Mix Decisions
7. Min/Max Asset Class Constraints
11. Canadian Equities Minimum Asset Allocation
12. No International Equities
14. Exclusion of Real Return Bonds
15. Effectiveness of Duration Policy[6]
16. Integration of real estate/infrastructure liabilities in duration management
18. Pension Fund[7]

On December 15, 2016 at a meeting of the Public Utilities Board, Mr. Valter Viola made recommendations to be addressed in this study. Mr. Viola, in the submission, represented the Consumers' Association of Canada ("CAC"). Phase One of the study answers CAC recommendations # 5, 7, 11, 12, 14, 16 and 18.

[5] This was originally slated for Phase Two as described in the *"Request for Proposal #2785 for Asset Liability Study"*. By mutual agreement between MPI and Mercer, it was moved to Phase One for greater project efficiency.

[6] See this report's section entitled: *"Assess Interest Rate Risk Management Strategy"*.

[7] See this report's section entitled: "Merits of Unique Asset Allocations".

5. RISK/RETURN DEFINITIONS FOR ASSET MIX DECISIONS

BACKGROUND

The CAC recommendation was:

"MPI should re-define return/risk used to inform its long-term asset mix decisions to be based on valuations that reflect market values, rather than accounting ones (which may be materially different). At a minimum, net income should be replaced by comprehensive income in the numerator (return) and retained earnings should be expanded to include accumulated other comprehensive income (AOCI) in the denominator (risk). In the long term, market returns and market risks will determine average long-term premium rates, regardless of how assets and liabilities are accounted for under GAAP."

RESPONSE

We agree that asset mix decisions should be based on market values. The 2017 asset liability study is based on market values.

7. MIN/MAX ASSET CLASS CONSTRAINTS BACKGROUND

BACKGROUND

The CAC recommendation was:

"The minimum/maximum and other constraints imposed on the portfolio (e.g., when asset-liability studies are conducted) should be reviewed and relaxed, to avoid costly constraints (lower risk-adjusted returns). The rationale for imposing any such constraints should be made explicit."

The 2017 Asset Liability Study will develop optimal asset allocations on both a minimally constrained and constrained basis. The minimally constrained basis considers the fact that MPI requires a reasonable level of investment liquidity to ensure cash is available to pay claims or pension benefits. The constrained basis will employ practical implementation considerations that cannot be modelled without constraints. Each of these constraints will be clearly documented and explained. For example MUSH bonds will have a minimum constraint as these bonds are not liquid and over the foreseeable future an allocation to MUSH will remain even if the study's results were to conclude that MUSH bonds should be eliminated.

RECOMMENDATION

The Asset Liability Study will review both minimally constrained and practical implementation constraints that will be well documented and explained.

11. CANADIAN EQUITIES' 10% MINIMUM ASSET ALLOCATION

BACKGROUND

The CAC recommendation was:

"The appropriateness and prudence of having a 10% minimum weight to Canadian Equities ("to retain a meaningful exposure to home markets") should be reconsidered, given the different interests of different stakeholders (e.g., employees through the pension plan), the concentrated nature of Canada's equity market, and other such relevant considerations."

ANALYSIS

Based on the MPI investment policy statement effective April 27, 2017, the asset allocation for Canadian equity has a policy weight of 10%, which is 67% of the 15% total policy allocation to public equities. Most institutional investors have significantly diversified their public equity portfolios such that allocations to Canadian equities are typically between 25% to 33% of total public equities. Such allocations still represent a modest home country bias (since Canadian equities are ~ 4-5% of total global equities), but are much more diversified than the current MPI allocation. Some Canadian institutional investors have completely eliminated any home country bias.

Investors who choose to maintain a healthy home country bias typically do so because of inertia, lower investment management fees, to reduce currency risks, or since correlation with Canadian inflation is slightly higher than for non-Canadian equities. Overall, we view the diversification benefits of a globally diversified public equity portfolio to be compelling.

IMPLEMENTATION CONSIDERATIONS

The 2017 Asset Liability Study will review the expansion of the equity portfolio to consider:

1. EAFE[8] Equities (often referred to as International Equities) which represents approximately 36% of the developed world's capital markets.

2. Global Low Volatility Equities which are global equity mandates that target between 20% - 30% reduction in return volatility as compared to the MSCI Global Equity Index.

RECOMMENDATION

We expect our recommendation will be to reduce the allocation of Canadian equities to be 25-33%[9] of total public equities.

---

[8] Europe Australasia Far East as defined by investment industry wide used benchmark provider MSCI.

[9] Based on no constraints on allocations to Canadian equity.

12. NO INTERNATIONAL EQUITIES

BACKGROUND

The CAC recommendation was:

"The appropriateness and prudence of having no exposure to International Equities should be reconsidered, given the large size of non-US foreign markets, the return opportunities that are potentially available from those missed opportunities and the effects of increased international diversification on long-term market risks."

ANALYSIS

As part of the Asset Liability Study conducted by Mercer in late 2017, the asset allocation policy is being revisited. To date, the review has discussed the relatively concentrated nature of Canada's equity market. The aim of the asset allocation policy review is to develop an asset allocation policy that is optimal in light of the appropriate level of risk. EAFE[10] Equities (often referred to as International Equities) represents approximately 36% of the developed world's capital markets. We fully support reviewing the diversification of the equity portfolio by including International Equities.

IMPLEMENTATION CONSIDERATIONS

Transitioning to a non-Canadian equity portfolio is relatively straightforward, particularly if suitable pooled funds are available

The alternative to optimizing allocations to US Equity and EAFE Equity is to bundle these two mandates into one mandate (typically referred to as 'global equities' and typically benchmarked to the MSCI World index). This is supported by the fact the lines are blurred when it comes to categorizing a stock as US Equity or EAFE Equity when you consider the level of corporate globalization. For example, categorizing Microsoft as US Equity and ignoring it's non-US operations does not make sense. At the same time, combining the mandates into one mandate allows the investment manager to select a best in class stock regardless of questionable geographical classification. This in turn, provides the manager with an additional lever to outperform market returns. An extension of this idea is to combine US Equity, EAFE Equity and Emerging Markets equity into a single mandate known as an All Country mandate, which is typically benchmarked to the All Country World Index ("ACWI"). ACWI mandates are currently composed of about 52% US, 32% EAFE, and 12% Emerging Markets Equities. Note that the decomposition of ACWI into geographical regions is considered irrelevant to many ACWI investment managers, given the level globalization present in the world. Also, note that Emerging Markets Equities include companies such as Samsung, TenCent and Alibaba (all of which have a market cap of over $200Billion).

[10] Europe Australasia Far East as defined by investment industry wide used benchmark provider MSCI.

RECOMMENDATION

We expect our recommendation to include an allocation to international equities. Note that the 2017 Asset Liability Study will not constrain the allocation to international equities.

14. EXCLUSION OF REAL RETURN BONDS

BACKGROUND

The CAC recommendation was:

"The role that RRBs can play in effectively managing relevant risks should be discussed, with consensus achieved regarding the effectiveness of RRBs from a risk management perspective (i.e., independent of the cost of any "insurance" as measured by RRB yields and their expected returns)."

Real Return Bonds ("RRBs") have the components of a conventional bond, coupon payments and return of principal at maturity. The distinguishing feature of the RRB is that both the periodic coupon payments and the return of principal at maturity are linked to the consumer price index ("CPI") over the respective term. The real yield (i.e., the yield in excess of CPI) is known at date of issue. The coupon payments and adjusted principal repayment depend on future inflation. This makes RRBs an explicit hedge against inflation risk.

The inflation sensitivities of MPI's three lines of business (Basic, Extension and Special Risk Extension ("SRE")), the Rate Stabilization Reserve ("RSR") and its employee pension plan ("MPI components") measured by duration are summarized in the table below:

Item	Basic	Extension	SRE	RSR	Pension
Sensitivity to Inflation Rate Changes (Duration[3])	10.4[2]	0.0[2]	0.0[2]	0.0[2]	12.6[1]

Duration is a measure of interest rate sensitivity. A real duration of 10 means a 1% decrease (increase) in the real interest rate used to calculate the liability will result in a 10% increase (decrease) in the liability. The duration of Canadian RRB market is currently approximately 15. Hedging a duration of 10 would simply mean having a 66%[11] allocation to RRBs.

[11] FTSE TMX RRB Index has a duration of about 15; whereas the MPI Basic liabilities have a real duration of about 10. This means a 66% RRB allocation would provide a real duration of 10 (i.e., 66% x 15 = 10).

ANALYSIS

RRBs are the most direct hedge to inflation, but provide no opportunity for additional real returns. Investors looking to balance return enhancement with inflation hedging often look to obtain an implicit or indirect inflation hedge using real assets, which are expected to deliver inflation sensitive returns (e.g., physical[12] real estate, physical infrastructure).

The Canadian RRB market is fairly large and liquid. There are currently 15 outstanding issuances, among which eight were issued by the Government of Canada and 7 are provincial issuances.

RRBs issued by the Government of Canada are the most liquid and currently have a total market value of about $72 Billion.

IMPLEMENTATION CONSIDERATIONS

Typically, RRB investment mandates are best handled by a passive manager with significant assets in RRBs relative to peer managers as this could aid in sourcing the less liquid RRB issues. These passive managers provide broad RRB market exposure at fee levels significantly lower than conventional bond mandates.

Due to the limited number of RRB issues and their specific maturity dates, developing a portfolio to match the inflation risk in the MPI components can be challenging. The challenge arises from trying to achieve a closely matching inflation-sensitive cash flow between assets and the respective component's projected claims or pension payments.

RECOMMENDATION

We agree that RRBs can provide an effective hedge against CPI linked obligations MPI has approved the inclusion of RRBs in the 2017 Asset Liability Study.

16. INTEGRATION OF REAL ESTATE/INFRASTRUCTURE LIABILITIES IN DURATION MANAGEMENT

BACKGROUND

The CAC recommendation was:

"MPI should consider the liabilities arising from all sources (i.e., including real estate and infrastructure) in its interest rate risk management practices (duration), to be consistent with its management of risks arising from insurance, pension and other liabilities. The financial leverage assumptions used in Asset-Liability Studies that support long-term asset mix decisions should be

[12] Physical real estate investment means actually investing in a physical property that produces income and capital gains or losses. This should not be confused with real estate investments that invest in the stocks of real estate companies.

made consistent with the leverage actually used in the portfolio, removing the ~ 4% difference related to real estate debt."

MPI's real estate investment is a direct investment in property, as opposed to an investment in real estate corporation stocks. Similarly, MPI's infrastructure investment is direct rather than investing in infrastructure corporations.

ANALYSIS

While it is true that interest rate risk exists in Real Estate and Infrastructure, we suspect that the duration will be relatively short when compared to MPI liabilities as debt terms in these investments can be short in term and interest rates can be floating. As such, it is extremely rare to consider duration risk of the underlying liability in these investments.

The following illustration provides a sense of the level of materiality:

Target Allocation to Real Estate	10%
Leverage used in Greystone real estate fund	25%
Assumed Duration of Debt	4*
Duration of Real Estate as a portion of overall MPI portfolio	0.10

*** Provided by Greystone on October 27, 2017.**

Analysis as at June 30, 2017

RECOMMENDATION

The Asset Liability Study will consider the use of leverage in the Real Estate and Infrastructure and how it may influence the overall duration of the portfolio. At this point, we do not expect it to be material nor worthy of hedging.

18. PENSION FUND

BACKGROUND

The CAC recommendation was:

> *"The interests of all relevant stakeholders should inform decisions regarding both the accounting for and management of the assets and liabilities related to the pension plan and other employee benefits. A desirable outcome is to have greater clarity around the appropriateness and prudence of maintaining different types of assets and liabilities commingled in one fund."*

Currently, MPI commingles the assets of the three lines of business (Basic, Extension and Special Risk Extension ("SRE")), the Rate Stabilization Reserve ("RSR") and its employee pension plan (the "components").

As per the Actuarial Valuation Report as at December 31, 2016 – Pension Liabilities of Manitoba Public Insurance (As a result of participation of its employees in the Civil Service Superannuation Act):

> *"At present, MPI is contributing to the CSSF[13] based on the pay-as-you-go method of funding. Under this method, no advance funding payments for the employer share of the cost of pensions are made to the CSSF. MPI has, however, established a reserve against general assets which is being increased to match the increase in its pension liabilities."*

As per Note 16 of MPI's Annual Financial Statements for the Fiscal Year Ended February 28, 2017 ("MPI 2017 Annual Report"):

> *"The Corporation has not segregated investment assets to fund the benefit plans. Funding occurs as benefits are paid. The Corporation has established a provision against general assets, which is being increased to match the increase in its benefit plan liabilities."*

The current approach to Pension Fund assets is as follows:

1. The accounting basis liability for MPI's pension obligations is calculated by an independent actuary in accordance with International Financial Reporting Standards – International Accounting Standard 19.

2. An amount equal to 1. is carved out of the commingled assets and is assigned as pension assets supporting the liability determined in 1.

Under the current approach, where the performance of commingled assets differs from the change in pension liabilities, a gain (or loss) is incurred by the commingled fund and impacts the assets remaining for other Components. The primary economic drivers of changes in pension liabilities are changes in long-term interest rates and inflation expectations. For example:

- a decrease in applicable interest rates will increase the size of the pension liabilities, which in turn will increase the size of the provision against general assets; and
- an increase in applicable interest rates will decrease the size of the pension liabilities, which in turn will decrease the size of the provision against general assets.

OBSERVATIONS

The characteristics of the pension liabilities are different than MPI's three lines of business (Basic, Extension and SRE) and the RSR liabilities. The following is a non-exhaustive list of differences:

[13] CSSF is the Civil Service Superannuation Fund.

- Sensitivity to interest rates and which interest rates are used to determine the liability, and therefore the provision against general assets
- Sensitivity to rates of inflation and pensionable earnings
- Longevity of current and future retirees (but impractical to hedge using financial assets)
- Rates of retirement, termination of employment and disability of employees participating in the pension plan (but impractical to hedge using financial assets)

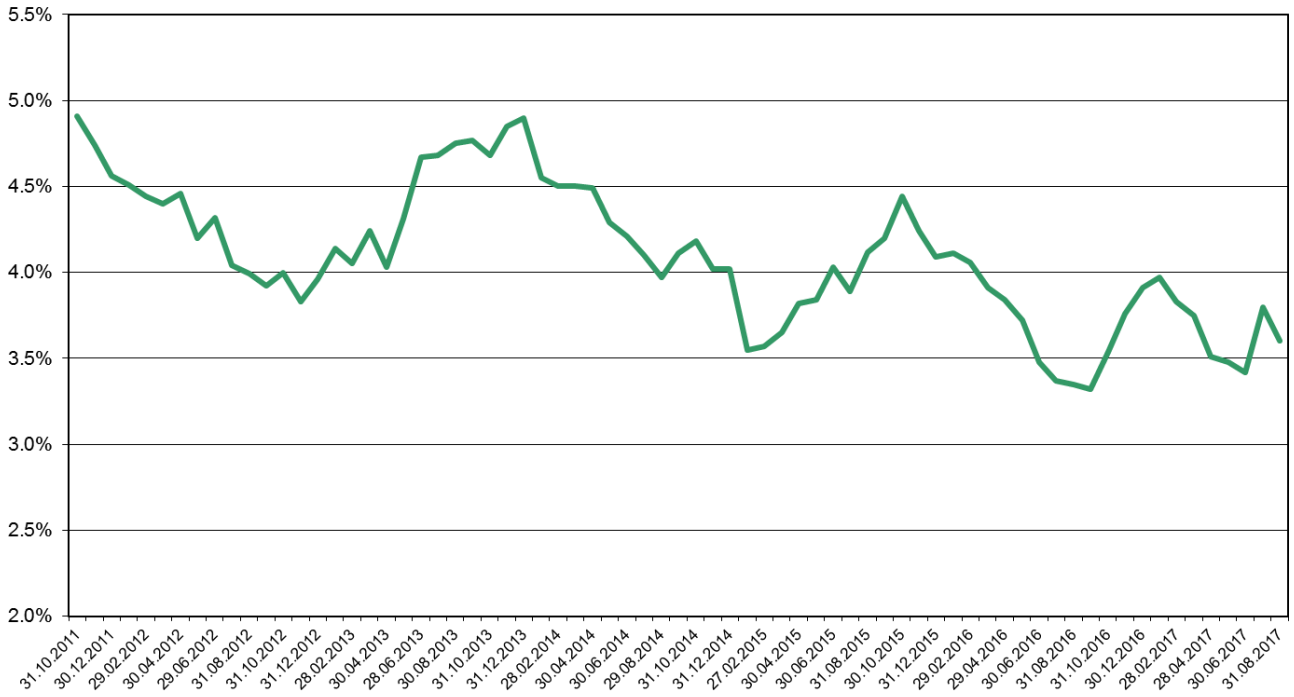
The following table summarizes certain sensitivities disclosed in the MPI 2017 Annual Report.

	Results in '000s			% Change Relative to the Defined Benefit Obligation at 3.89%		
February 28, 2017	Pension	Other Benefits	Total	Pension	Other Benefits	Total
Defined benefit obligation at 3.89%	$353,052	$52,006	$405,058			
Discount rate sensitivities						
• Defined benefit obligation at 4.89%	$298,855	$47,836	$346,691	(15.4%)	(8.0%)	(14.4%)
• Defined benefit obligation at 2.89%	$423,887	$56,120	$480,009	20.0%	7.9%	18.5%
Other sensitivities						
• Defined benefit obligation with +1 year to life expectancy	$358,699	$52,485	$411,184	1.6%	0.9%	1.5%
• Inflation indexing (2/3rds COLA) +1%	$384,071	$52,006	$436,077	8.8%	-	7.7%
• Inflation indexing (2/3rds COLA) -1%	$325,547	$52,006	$377,553	(7.8%)	-	(6.8%)
• Health care cost inflation +1%	$353,052	$57,461	$410,513	-	10.5%	1.3%
• Health care cost inflation -1%	$353,052	$47,823	$400,875	-	(8.0%)	(1.0%)

As per the above results, the defined benefit obligation for pension is most sensitive to changes in the applicable discount rate and the duration of MPI's pension obligations is in the range of 15.5-18. It is our understanding that the discount rate used is a single rate that approximates the present value of MPI's pension benefit obligation cash flows to the present value of those cash flows using the Canadian Institute of Actuaries' ("CIA") model yield curve for financial reporting purposes.

The following is a chart that displays the evolution of CIA discount rates since October 31, 2011 to September 29, 2017 for a sample pension plan with duration of 16.

Evolution CIA Discount Rates Over Time for Sample Plan with Duration of 16
(new CIA model (CIA 2.0) starting on November 30, 2016)



The following table is a summary of MPI's defined benefit obligations at each fiscal year end from February 28, 2011 to February 28, 2017:

Fiscal year ending	Duration	Discount rate	Change in discount rate	Defined benefit obligation (Results in '000s)		
				Pension	Other benefits	Total
Feb. 28, 2011	Not disclosed	4.85%		$218,872	$38,940	$257,812
Feb. 28, 2012	Not disclosed	4.20%	(0.65%)	$260,415	$40,847	$301,262
Feb. 28, 2013	Not disclosed	3.90%	(0.30%)	$285,360	$46,475	$331,835
Feb. 28, 2014	16.0	4.20%	0.30%	$285,326	$47,812	$333,138
Feb. 27, 2015	17.15	3.60%	(0.60%)	$339,334	$51,785	$391,119
Feb. 29, 2016	16.29	4.05%	0.45%	$328,390	$49,727	$378,117
Feb. 28, 2017	15.6	3.89%	(0.16%)	$353,052	$52,006	$405,058

As can be seen from the previous chart and the above table, the discount rate used to determine MPI's pension obligations is volatile and therefore the provision against general assets for pension is correspondingly volatile. Over the past 7 fiscal year ends, the average discount rate is 4.10%, the minimum discount rate is 3.6% and the maximum discount rate is 4.85%. We estimate that the impact of the 60 basis point decrease in discount rate from 4.2% to 3.6% at February 27, 2015 was an increase in pension obligations, or a loss, of approximately $33-$35 million (assuming all else being equal).

RECOMMENDATION

Given the above observations and assuming that MPI will continue with its current policy with respect to the pay-as-you-go method of funding, MPI should consider segregating its pension assets from its insurance related assets. This will allow for:

- An asset allocation that considers the characteristics of the pension liabilities in isolation and the risk appetite of MPI;
- Enhanced transparency with respect to MPI's pension portfolio and possible re-allocations to or from MPI's three lines of business (Basic, Extension and SRE) and the RSR, if applicable;
- MPI's three lines of business (Basic, Extension and SRE) to have metrics that could be independent of the pension portfolio and can assist in accountability.

1 INTRODUCTION

BACKGROUND ON THE FUND

Manitoba Public Insurance ("MPI") maintains investment funds (the "Fund") in respect of the liabilities of MPI in accordance with the Manitoba Public Insurance Corporate Act (the "Act"). As of August 31, 2017, assets of the Fund totaled $2,695Million as summarized below:

Fixed Income		Equities		Alternatives	
$1,852.2M	68.7%	$434.9M	16.1%	$408.7M	15.2%
Cash	0.5%	Canadian	11.2%	Real Estate	11.6%
Federal Bonds	4.5%	US	4.9%	Infrastructure	3.5%
Provincial Bonds	34.2%			Private Equity	0.1%
Corporate Bonds	6.0%				
MUSH Bonds	24.1%				

The Fund's asset allocation policy (the "Policy") is the most important factor driving Fund performance. The Policy has been determined in light of the Fund objectives. The Policy reflects the characteristics of the underlying obligations and a risk/return tradeoff selected by the MPI Investment Committee ("Committee"). The Policy aims to maximize return while minimizing risk in an overall portfolio context, while considering practical investment implementation implications.

PURPOSE OF STUDY

In September 2017, MPI undertook a Policy review (the "Study") following an order by the Public Utilities Board ("PUB"). The current Policy was last set approximately 3 years ago. The primary purpose of the Study was to identify and recommend Policy allocations that reflect MPI's risk and return objectives, asset size, and governance structure. In addition, the Study was to respond to a number of recommendations submitted by the Consumers' Association of Canada.

MPI retained Mercer to assist in this Study. Mercer provides expertise in the development of an asset allocation policy through asset liability studies. Mercer worked with the staff and management of MPI throughout the study and authored this report. All figures related to MPI in this report were provided to Mercer by MPI.

OVERVIEW OF MPI'S OBLIGATIONS

For the purpose of the Study, obligations of MPI were segmented amongst the following 5 components ("Components"):

	BASIC	EXT	SRE	RSR	PENSION
What's included	Compulsory: auto insurance claims	Optional: auto insurance claims	Competitive: fleet insurance claims & Provincial Facilities	Retained earnings from Basic	Employee Benefits
Size[1]	$1,790M	$106M	$147M	$97M	$405M
Purpose	Pay claims as they come due			Stabilize rates	Fund pension benefits
Return Expectation/ Risk Tolerance	Very low risk tolerance. Could grow in future.	Moderate	Moderate	Moderate	Moderate
Interest Rate Sensitivity (Duration)	High (10.5)	Low (1.1)	Low (2.7)	Not applicable	Very high (15.6)

Basic Claims Liabilities are subject to significant interest rate risk and require a high level of liquidity to pay claims. Given that the Basic insurance business:

1. comprises approximately 88% of the total business based on net claims incurred, and

2. that no new rates or fees for Basic services can be introduced without the approval of the PUB,

the risk tolerance for assets supporting Basic is very low. To meet these objectives and reflect the nature of Basic, MPI's proposed Policy for Basic is to attempt to hedge substantially all of its nominal interest rate risk by investing in bonds with nominal interest rate duration that matches[2] the

[1] Source: Financial Statement at February 28, 2017.

[2] Most Basic liabilities are subject to inflation risk. After considering the cost of hedging inflation risks and the likelihood of future increases in inflation, MPI decided to hedge the nominal interest rate risk of Basic liabilities assuming that inflation linked obligations increase at 2% per annum. By matching the duration of assets to the duration of liabilities, MPI will be able to efficiently construct portfolios that allow for return enhancement. A fully cash flow matched asset portfolio would mitigate both duration and convexity risk, but would require MPI to sacrifice opportunities to diversify its fixed income portfolio and enhance yields. We are supportive of MPI's strategy decision in the regard.

duration of Basic liabilities. Given MPI's low tolerance for risk, the proposed Policy for Basic will not include equities or alternative investments.

SRE and Extension Claims Liabilities are subject to low interest rate risk and require a high level of liquidity to pay claims. The risk tolerance for SRE and Extension Claims Liabilities are moderate. Given the moderate tolerance for risk, MPI's proposed Policy for these lines reflects a balanced portfolio of bonds, equities and alternative investments. MPI's proposed Policy for SRE and Extension Claim bonds includes modestly higher allocations to non-government bonds than the more conservative Basic Policy.

The RSR is essentially surplus assets excluding accumulated other comprehensive income ("AOCI"). The intent of the RSR is to protect motorists from rate increases made necessary by unexpected events and losses arising from non-recurring events or factors. There is no underlying obligation therefore there is no targeted interest rate risk hedge. The size of the RSR dictates the capacity to stabilize rate increases. Currently, MPI's risk tolerance for RSR is moderate. Given the moderate tolerance for risk, MPI's proposed Policy for these lines reflects a balanced portfolio of bonds, equities and alternative investments. MPI's proposed Policy for SRE and Extension Claim bonds includes modestly higher allocations to non-government bonds than the more conservative Basic Policy.

Pension assets support MPI employee pension liabilities in conjunction with MPI's unfunded portion of the Civil Service Superannuation Board of Manitoba ("CSSB") pension obligations. Pension liabilities are subject to interest rate risk tied to high quality long-term corporate bond yields. Risk tolerance is moderate. CSSB has an asset allocation policy that allocates approximately 30% to bonds and 70% to equities and alternative asset classes. MPI's proposed Policy for these pension assets is an allocation slightly less aggressive than that of CSSB (40% to bonds and 60% to equities and alternative asset classes).

2
KEY RECOMMENDATIONS

CONSOLIDATION VS. SEGREGATION

Currently, MPI commingles the assets of the Components with the same Policy mix applying to each. This Study recommends the identification and segregation of unique asset allocations by Component for the following reasons:

1. Better alignment of the Policy with characteristics and needs of each Component.
2. Better attribution of investment income and gains/losses across each Component to assist in accountability and pricing.
3. Better visibility of each Component's portfolio while maintaining the ability to re-allocate assets between components as their obligations evolve.

MPI has recommended unique Policy allocations for the Basic and Pension Components, along with a consistent Policy allocation for each of RSR/SRE/Extension. Segregation of the assets of each Component will likely take some time to fully implement as MPI makes necessary changes to internal accounting and attribution systems.

NEW ASSET CLASSES

As part of the overall review of MPI's risk and return objectives, several new asset classes were considered to assess the extent to which they would be expected to improve the risk/reward trade-off of the Fund relative to the underlying obligations. The following two tables summarize the new asset classes included, and excluded, from MPI's recommended Policy and a brief discussion of the rationale for each:

ASSET CLASS	RATIONALE FOR INCLUSION IN RECOMMENDED ASSET ALLOCATIONS
Corporate Bonds	Investment grade Canadian corporate bonds. Corporate bonds generally increase yields over Provincial bonds; however, the credit spread varies by issuer (some Corporates are higher quality than some Provinces) and over time. Corporate bonds are available in various maturities to help hedge interest rate risk of underlying obligations, which vary in duration. Careful due diligence of corporate bond issuers and diversification of credit risks are key to delivering excess returns, as over the last 5 years, the median Canadian corporate manager has significantly outperformed the passive index by 39 basis points.
Private Debt	Investment grade North American debt covering private corporate debt, infrastructure debt, power & energy debt and other forms of private debt. Typically, fully hedges US currency risk and yield curve changes. Since private debt is less liquid than public debt, it generally results in an increased yield over a comparable Canadian bond index[3] of about 0.75%. An allocation to North American private debt further diversifies credit risk beyond those of Canadian provinces and Canadian publicly traded bonds
All Country World Index Equities (ACWI)	Includes developed world market equities and emerging market equities to improve portfolio diversification. Allows an active investment manager the ability to select best in class stocks regardless of the relevant stock exchange geography. The standard ACWI benchmark is composed of approximately 52% US, 32% EAFE[4], and 12% Emerging Markets Equities.
Global Equity (Low Volatility)	Well-diversified developed world equities with return volatility of about 25% less than the standard global equity benchmark index. Offsets some of the ACWI equity volatility.

[3] Currently FTSE/TMX Canada Universe Bond Index yield is 2.3%

[4] Europe Australasia Far East as defined by investment industry wide used benchmark provider MSCI.

EXCLUDED ASSET CLASSES

These asset classes were considered as part of the Study, but excluded from the Policy recommendation:

ASSET CLASS	RATIONALE FOR EXCLUSION IN RECOMMENDED ASSET ALLOCATIONS
Real Return Bonds	Real return bonds ('RRBs') are inflation-linked bonds that are typically used to hedge inflation risk. While basic claim liabilities and pension liabilities are indexed to inflation; a number of factors contributed to the exclusion of RRBs from the Policy recommendation, including: 1. RRB real yields are relatively low, averaging ~0.6% through November 2017. 2. MPI's Basic liabilities assume a 2% inflation rate. If future inflation is near this rate, these obligations can be most efficiently hedged with traditional bonds. RRBs will only be worth their cost if inflation is well in excess of 2%, but will cause MPI to incur losses if inflation is flat. 3. Duration and dollar matching liabilities is challenging with RRBs. The Canadian RRB market consists of 15 issues of which only 7 are liquid and all are government issued. 4. RRBs are traditionally indexed to the Canadian Consumer Price Index, while Basic Liabilities are indexed to other drivers.
Levered Bonds	Levered bonds allow investors to increase their exposure to longer duration securities via derivative contracts. Typically, investors pledge capital and pay a borrowing cost (typically short-term rates) and receive returns from a longer-term fixed income index (such as Long-Term Provincial Bonds or RRBs). Levered bonds can be implemented directly or via institutional pooled funds which helps to diversify their counterparty risks. Levered bonds can provide capital efficient matching of desired duration or inflation exposures and are well suited for investors who are looking to match interest rate risk while maintaining healthy allocations to a growth portfolio. Given MPI's preference to avoid equity exposure or additional types of risk within the Basic Portfolio, Levered Bonds are not included in the Policy recommendation. For the other Components, the desire is not to use leverage in the Portfolio.
Diversified Growth Funds	Diversified Growth Funds come in a variety of forms, but generally combine a diversified set of return drivers in an attempt to provide a more efficient return than traditional balanced funds. They typically use a combination of derivative positions as well as direct holdings. While many diversified growth funds are less expensive than traditional hedge funds, they can be more expensive than direct holdings. Given MPI's desire to reduce, rather than increase, exposure to growth assets, they are not included in the Policy recommendation.

ASSET CLASS	RATIONALE FOR EXCLUSION IN RECOMMENDED ASSET ALLOCATIONS
Private Equity	Private equity can provide institutional investors opportunities to enhance long-term returns by committing capital for longer periods to entities that are not subject to public market reporting requirements and/or are smaller with respect to market capitalization. Given MPI's desire to reduce, rather than increase exposure to growth assets, they are not included in the Policy recommendation.

NEW ASSET ALLOCATIONS

Following a thorough review of the relative merits of the asset classes noted above and after considering the purpose of each business line and MPI's risk tolerance and return requirements, Mercer modeled multiple combinations of asset classes utilizing efficient frontier concepts as well as stochastic projections of both assets and MPI's obligations utilizing the economic assumptions outlined in Appendix B.

Based on this analysis, MPI management recommended the following Policy portfolios for each business line and Pension obligations:

	CURRENT	PROPOSED BASIC	PROPOSED SRE/EXT RSR	PROPOSED PENSION
Fixed Income	**70%**	**100%**	**50%**	**40%**
Short-term Bonds (Prov.)	6.5%	0%	10%	0%
Mid-term Bonds (Prov.)	12%	28%	10%	0%
Long-term Bonds (Prov.)	29.5%	32%	0%	0%
Short-term Bonds (Corp.)	0%	0%	0%	0%
Mid-term Bonds (Corp.)	0%	9%	10%	0%
Long-term Bonds (Corp.)	2%	11%	0%	20%
MUSH Bonds	20%	20%	5%	0%
Private Debt - Universe	0%	0%	15%	0%
Private Debt - Long	0%	0%	0%	20%
Public Equities	**15%**	**0%**	**35%**	**35%**
Canadian Equity	10%	0%	12%	10%
U.S. Equity	5%	0%	0%	0%
All Country World Equity	0%	0%	13%	18%
Global Equity (Low Volatility)	0%	0%	10%	7%
Alternatives	**15%**	**0%**	**15%**	**25%**
Real Estate	10.%	0%	10%	15%
Infrastructure	5%	0%	5%	10%

The recommended asset allocation policies have the following overall impact:

RETURN

	CURRENT	PROPOSED	IMPACT
Expected Annual Total Return	4.3%	3.9%	$11M p.a. reduction in expected return
Non-MUSH Yield – ALL	2.75%	3.02%	$6M p.a. increase
Non-MUSH Yield – Basic	2.75%	2.92%	Liability decrease of $40M

RISK

	CURRENT	PROPOSED	IMPACT
1 in 20 year downside event impact on surplus	-$142M	-$75M	Improved by $67M
Interest Rate Risk Hedged	73%	87% (100% for Basic)	Significant reduction in interest rate risk.

3
IMPLEMENTATION CONSIDERATIONS

CONSOLIDATION VS SEGREGATION

The Study recommends segregation of Component assets; however, the MPI internal accounting system is designed to accommodate a consolidated asset approach. MPI is considering the implications of moving to a segregated assets model.

In the meantime, we recommend that MPI roll-up the new asset allocation policies for each Component into a consolidated policy as follows:

ASSET CLASS (GROUP)	MINIMUM	NORMAL	MAXIMUM	ACCOUNTING CLASS[5]
Cash and short-term	0.0%	0.0%	5.0%	AFS
Fixed Income				
Provincial Bonds	35%	45%	55%	FVTPL
Corporate Bonds	6%	19%	23%	FVTPL
Non-Marketable Bonds[6]	10%	20%	25%	HTM, FVTPL
Total Fixed Income	**70%**	**84%**	**90%**	
Public Equities				
Canadian Equity	0%	3%	10%	AFS
Global Equity[7]	0%	5%	10%	AFS
Global Low Volatility Equity	0%	2%	5%	AFS
Total Public Equity	**0%**	**10%**	**20%**	
Alternative Investments				
Canadian Real Estate	0%	4%	12%	FVTPL
Infrastructure	0%	2%	5%	FVTPL
Total Alternative Investments	**0%**	**6%**	**12%**	

RECOMMENDED ASSET ALLOCATIONS

As at February 28, 2017, MPI's investment assets totalled $2,547Million. Based on this amount, the recommended asset allocations are as follows:

	FIXED INCOME		EQUITIES		ALTERNATIVES		TOTAL
Basic	$ 1,790M	100%	$ -	0%	$ -	0%	$ 1,790M
SRE	74M	50%	52M	35%	$ 22M	15%	$ 148M

[5] AFS – Available for Sale, HTM – Held to Maturity, FVTPL – Fair Value Through Profit and Loss.
[6] Consists of Municipal University Schools Hospital ("MUSH") Bonds and Private Debt.
[7] Includes U.S., EAFE and to a lesser extent Emerging Market Equities.

	FIXED INCOME		EQUITIES		ALTERNATIVES		TOTAL
RSR	49M	50%	34M	35%	$ 15M	15%	$ 98M
Extension	53M	50%	37M	35%	$ 16M	15%	$ 106M
Pension	162M	40%	142M	35%	$ 101M	25%	$ 405M
Total Target	**$ 2,128M**	**84%**	**$ 265M**	**10%**	**$ 154M**	**6%**	**$ 2,547M**

Implementation of the asset class changes are expected to be phased in over a 2-year period. Assuming no change in asset values, implementation of the recommended asset allocations would require the following changes relative to the current overall asset allocation:

	FIXED INCOME		EQUITIES		ALTERNATIVES	
MPI Balance as at Aug 31 2017	$1,732M	68%	$428M	17%	$387M	15%
Change	+$396M	+15%	-$163M	-6%	-$233M	-9%

A summary of the proposed changes to the portfolio and anticipated timing are summarized as follows:

	PROPOSED	TIMING
Provincials	Duration shifting	Q1 2018
Corporate Bonds	Add 1-2 mandates	by Feb. 28, 2019
Private Debt	Add 1-2 mandate	2019
MUSH Bonds	Manage liquidity	Gradually over 24 months
Equities	Add 2 mandates	2018

APPENDIX A

RFP ITEMS

On September 12, 2017, MPI issued a Request for Proposal #2785 For Asset Liability Study. Section 5.03 list items to be addressed in the Study during Phase Two. The table below lists these items and indicates where the item is discussed in this report.

SECTION	DESCRIPTION	ADDRESSED IN
5.03(a)	Analyse risks of liabilities in context of corporate goals	Section 1. Overview of MPI's obligations.
5.03(b)	Quantification of risk/return parameters	Section 2. New Allocations.
5.03(c)	Investment characteristics of new asset classes and impact of new asset classes	Section 2. New Asset Classes, Excluded Asset Classes.
5.03(d)	Evaluation of probability of meeting expectations under various scenarios	Appendix D
5.03(e)	Asset class optimization	Section 2. New Asset Classes, Excluded Asset Classes.
5.03(f)	Recommend asset allocation	Section 2. New Allocations.
5.03(g)	Recommend allocation to corporate bonds	Section 2. New Allocations.

APPENDIX B

10-YEAR FORWARD LOOKING CAPITAL MARKET ASSUMPTIONS

ASSET CLASS RETURNS AND VOLATILITY

	Asset Class	Median 10 year return	Standard deviation
1	Treasury Bills	1.4%	1.5%
2	Federal short-term bonds	1.9%	3.5%
3	Federal mid-term bonds	2.1%	6.5%
4	Federal long-term bonds	2.0%	8.5%
5	Real return bonds	2.7%	7.5%
6	Provincial short-term bonds	2.3%	3.5%
7	Provincial mid-term bonds	2.8%	6.5%
8	Provincial long-term bonds	3.0%	8.5%
9	Corporate short-term bonds	2.8%	3.5%
10	Corporate mid-term bonds	3.5%	6.5%
11	Corporate long-term bonds	3.8%	8.5%
12	Global bonds	0.8%	8.6%
13	High yield bonds	3.9%	9.5%
14	Emerging debt	6.8%	12.0%
15	Canadian equity (large cap.)	6.7%	19.5%
16	U.S. equity (large cap.)	6.7%	17.0%
17	Int'l equity (large cap.)	6.7%	17.1%
18	Global equity (large cap.)	6.7%	16.1%
19	Global low vol equity	6.1%	13.0%
20	Emerging equity	8.7%	25.0%
21	Private equity	10.1%	25.0%
22	Real estate	5.4%	13.0%
23	Diversified Growth Fund	4.9%	9.8%
24	Direct Infrastructure	6.2%	13.0%
25	MUSH Bonds	3.0%	6.5%
26	Commercial Mortgages	2.7%	3.5%
27	Long Commercial Mortgages	2.5%	5.3%
28	Private Debt - Universe	3.3%	5.4%
29	Private Debt - Long	3.5%	8.5%

Source: Mercer's Canadian long-term capital market assumptions (August 31, 2017). Expected return represents expected return over the next 10 years.
Note: 3X Long Provincial Bonds is defined as 300% Provincial Long Bonds less 200% Treasury Bills and a 0.7% leverage cost. 3X Real Return Bonds is defined as 300% Real Return Bonds less 200% Treasury Bills and a 0.7% leverage cost.

Inflation: 2.0%

Fixed income returns based on projected yields implied by the current forward yield curve.

APPENDIX C

SUMMARY OF PHASE ONE

TOPIC	ANALYSIS/DISCUSSION	MPI CONCLUSION
Should each business have a unique asset allocation?	The profile of the obligations and risk of each of the 3 lines of business, RSR and Pension is unique. At a minimum, each business should be assessed individually. Preliminary recommendation is to adopt unique asset allocations.	Decision on whether to aggregate or segregate assets depends on dispersion of objectives.
What are MPI's Investment Goals?	The current IPS emphasizes mitigating risk resulting from interest rate variations and mitigating the risk of short-term premium volatility. It also indicates that minimizing premium levels is an objective. Clarifying investment goals for each business line is recommended.	Will define the purpose and objectives for each business line.
Inflation linkage of liabilities	Much of MPI's obligations are linked to future levels of inflation. Real return bonds are the best hedge for future inflation.	Given low inflation expectations, hedge nominal, but not real, interest rate risk.[8]
Merits of New Fixed Income Exposure	Reviewed the relative merits of Federal Bonds, Real Return Bonds, Private Debt, Corporate Bonds Commercial Mortgages, Levered Bonds, and Growth Fixed Income. Analysis considered historical and expected risk and returns, duration matching potential, cost, and implementation considerations.	Consider private debt and corporate bonds as new asset classes.
Interest Rate Risk Management Strategy	Discussed the merits of duration matching, cashflow matching, and a hybrid approach.	Focus on duration matching for 100% of Basic liabilities.

[8] See "Excluded Asset Classes" for a fuller discussion on this item.

TOPIC	ANALYSIS/DISCUSSION	MPI CONCLUSION
Economic Assumptions	Mercer's long-term assumptions assume a gradual rise in interest rates to a long-term equilibrium state. Alternatively, we are comfortable assuming shifts in future yields implied by current forward rates.	Projections and analysis will be based on implied forward rates.
Merits of New Growth Portfolio Exposure	Reviewed the relative merits of International Equities, Global Equities, Low Volatility Global Equities, Emerging Markets, Private Equity, and Diversified Growth Funds.	Consider allocations to Global Equities (including Emerging Markets), Low Volatility Global Equities, and Private Equities.

APPENDIX D

SUPPORTING ANALYSIS

The MPI Investment Committee selected the following portfolios for each line and Pension, in order to reduce investment risk for Basic claims, and develop balanced portfolios for SRE/Extension, RSR and Pension.

The following tables summarizes the Current and Recommended asset allocations and provides the risk and return metrics for each:

	CURRENT	RECOMMENDED			
	CONSOLIDATED	CONSOLIDATED	BASIC	SRE, EXT, RSR	PENSION
Fixed Income	**70%**	**84%**	**100%**	**50%**	**40%**
Public Equities	**15%**	**10%**	**0%**	**35%**	**35%**
Alternatives	**15%**	**6%**	**0%**	**15%**	**25%**
Risk/Return Metrics					
Expected Annual Total Return	4.29%	3.9%	3.12%	5.15%	5.69%
Non-MUSH Yield	2.75%	3.02%	2.92%	2.73%	3.72%
1 in 20 year downside event impact on surplus	-$142M	-$75M	-$38M	-$36M	-$54M
Interest Rate Risk Hedged	73%	86%	100%	Not applicable	36%
Probability of positive real return in 5yrs	80%	74%	64%	83%	83%
Probability of surplus in 5 years	76%	82%	71%	84%	62%

1 FIXED INCOME BENCHMARK AND ATTRIBUTION RECOMMENDATIONS

(a) A review of the benchmark for the Corporation's fixed income portfolio with particular focus on ways to implement fixed income attribution analysis. The current benchmark is liability based. Provide the considerations related to switching to a market based benchmark.

BACKGROUND

MPI's fixed income portfolio is geared towards matching the interest rate sensitivity (i.e. duration) of liabilities. MPI's current interest rate risk management policy, which drives the construction of the fixed income portfolio, is outlined in MPI's Asset Liability Management policy and is summarized as follows:

- Duration[1] matching fixed income portfolio strategy to closely match claims liabilities in both dollar amount and duration.
- Fixed income manager will have *market value* of duration matching portfolio within *+/- $100M* of the *present value of claims liabilities*[2] in the previous month end.
- Duration matching portfolio will be within +/- 0.25 years of claims liability duration including the Provision for Adverse Deviation ("PfAD").

The duration of MPI's liabilities can be summarized as follows:

Duration Measure	Basic	Extension	SRE	RSR	Pension
Sensitivity to Interest Rate Changes	10.5	1.1	2.7	0.0	15.6
Sensitivity to Inflation Rate Changes	10.4	0.0	0.0	0.0	12.6

[1] Duration is a measure of interest rate sensitivity. A duration of 10 means a 1% decrease (increase) in the interest rate used to calculate the liability will result in a 10% increase (decrease) in the liability.

[2] $1.9 Billion as at February 28, 2017 for all insurance lines. Source is MPI Financial Statements as at February 28, 2017.

©2017 MERCER (CANADA) LIMITED

The annual expected return of the fixed income portfolio and its benchmark is outlined in the Investment Policy Statement (IPS), is as follows:

– Return on the present value of the Corporation's claim liability cash flows over the measurement period.

MPI's current fixed income portfolio is benchmarked against the present value of cashflow obligations. Given the dynamic nature of its obligations, this makes attribution very challenging.

Why establish benchmarks?

An effective benchmark serves two primary purposes:

1. Provide the investment manager with an appropriate investment management objective for managing the investment portfolio.
2. Acts as a standard against which the performance of the investment manager can be measured.

In order to effectively fulfill these two purposes, a benchmark should be:

1. **Specified in advance**. The benchmark is specified at the start of the mandate or evaluation period and is known to both the investment manager and the investor.
2. **Appropriate**. The benchmark is consistent with the investor's desired approach and style, as well as with the approach, style, knowledge and expertise of the appointed investment manager.
3. **Unambiguous**. The benchmark's composition (i.e. its constituents and their weights) is clearly defined.
4. **Measurable**. The benchmark's composition and return can be determined on a reasonably frequent basis.
5. **Accountable**. The investment manager accepts the applicability of the benchmark and agrees to accept that differences in performance between the portfolio and the benchmark are caused only by their active management.
6. **Investable**. It is possible to forgo active management and instead passively replicate the benchmark.

In terms of performance measurement, in addition to being used as a reference against which portfolio performance can be compared, a benchmark can also be used to help identify and quantify the sources of the portfolio's return through attribution analysis.

©2017 MERCER (CANADA) LIMITED

When it comes to conducting performance attribution analysis for a fixed income portfolio there is no single standard method. As a result, approaches taken to dissect fixed income returns can vary in terms of the number of factors looked at and the degree of precision.

©2017 MERCER (CANADA) LIMITED

Here is an example of attribution for diversified bond portfolio over a 1 year period:

Factor	Measure Impact of…	Numerical Example
Beta (Asset Allocation Decisions)		
Expected Interest Rate Effect	Market performance due only to interest rate movements had interest rates moved as predicted by the forward curve	0.44%
Unexpected Interest Rate Effect	Performance during the period due to interest rates that was not predicted by the forward curve	0.54%
Alpha (Investment Manager Decisions)		
Interest Rate Management Effect	Manager's portfolio positioning with respect to interest rates (e.g. duration, convexity)	0.17%
Sector/Quality Management Effect	Manager's portfolio positioning with respect to spreads	-0.11%
Security Selection	Actual securities selected by the manager	0.05%
Trading Activity	Any additional unexplained portion of the portfolio's return; which is attributed to the manager's trading activity	-0.02%
Total		**1.07%**

When conducting fixed income performance attribution, a benchmark portfolio of securities is required in order to calculate the investment manager's relative positioning with respect to, and assess the movement coming from, certain sources of return. One of these sources of return is the effect of interest rate movements (i.e. changes to the yield curve) on the investor's fixed income portfolio. A benchmark portfolio allows for the assessment of the investment manager's success in positioning the portfolio not only for parallel shifts in the yield curve, but also for steepening,

©2017 MERCER (CANADA) LIMITED

flattening or other changes in shape of the yield curve. A valid and relevant benchmark portfolio is therefore a key input for performance attribution.

The two most intuitive ways to build a benchmark portfolio are by using broad market indices (e.g. FTSE TMX Canada Universe Bond Index) or by using custom securities aligned with the mandate. The tradeoffs between these two approaches are outlined as follows:

Approach	Pros	Cons
Broad Market Indices	Well recognized and easy to understand and implement Unambiguous, measurable, usually investible, and can be specified in advance	May not be appropriate or accountable if the available broad market indices do not align perfectly with the investor's objective for their fixed income portfolio or if forcing a manager to use them as a reference point would in some way hinder their ability to achieve their objective
Custom Securities	Can allow for a benchmark to meet all of the benchmark validity criteria (i.e. unambiguous, measurable, investible, specified in advance, appropriate and accountable)	Can be difficult and expensive to construct and maintain

Given the above, the more common approach to constructing a benchmark portfolio, primarily on account of simplicity and cost, is to use broad market indices, but to tailor the portfolio as much as possible to the particular investment objective.

©2017 MERCER (CANADA) LIMITED

ANALYSIS & IMPLEMENTATION CONSIDERATIONS

For a benchmark to be appropriate and accountable, it must be in-line with the objective of the investment portfolio. Given that the overall objective of MPI's fixed income portfolio is to match the duration and dollars of liabilities within specified allowable ranges[3], the portfolio's benchmark should have a link to liabilities and reflect the asset class restrictions imposed on the manager.

To link the benchmark to liabilities, we recommend a benchmark portfolio that is consistent with the duration of liabilities. If the mandate is specifically constrained to a certain sector (i.e. Provincial bonds), it would be appropriate to construct the benchmark from indices within this sector.

RECOMMENDATION

We recommend MPI transition to a market-based benchmark for its fixed income portfolio, with unique market-based benchmarks for each component of the allocation:

	RECOMMENDED BENCHMARK
Fixed Income	
Short-term Bonds (Prov.)	FTSE TMX Short Term Provincial Bond Index
Mid-term Bonds (Prov.)	FTSE TMX Mid Term Provincial Bond Index
Long-term Bonds (Prov.)	FTSE TMX Long Term Provincial Bond Index
Short-term Bonds (Corp.)	FTSE TMX Short Term Corporate Bond Index
Mid-term Bonds (Corp.)	FTSE TMX Mid Term Corporate Bond Index
Long-term Bonds (Corp.)	FTSE TMX Long Term Corporate Bond Index
MUSH Bonds	FTSE TMIX Provincial Bond Indices matching liabilities in accordance with the ALM Policy
Private Debt - Universe	FTSE TMX Universe Bond Index
Private Debt - Long	FTSE TMX Long Term Bond Index

[3] See the MPI ALM Policy for further details.

©2017 MERCER (CANADA) LIMITED

2
UNIQUE ASSET ALLOCATION AND IPS

(b) If the Corporation decides to adopt a unique asset allocation for the three (3) lines of business, excess capital/retained earnings/Rate Stabilization Reserve (RSR) and pension assets, the Successful Vendor shall provide assistance in developing new Investment Policy Statements for each unique asset allocation.

A revised Investment Policy Statement identifying the unique asset allocations is provided under separate cover.

©2017 MERCER (CANADA) LIMITED

4
PUB ORDER 11.17

11.17 Add additional analysis/discussion of the bucket matching approach.

In Phase 1 of our analysis, we contrasted 3 approaches that institutional investment managers utilize to manage interest rate risk:

Approach	Pros	Cons
Duration Matching	Cost effective approach. Protects against parallel shift in yield curve. Provides more flexibility with regard to investment vehicles, particularly if return enhancement is a priority.	Does not protect as well against non-parallel shifts in comparison to other approaches.
Cash Flow Matching	Higher resolution matching Protects against reinvestment risk, including non-parallel yield curve shifts	Precision of claims/benefits projections may not merit high resolution matching, as projected cash flows can be materially different from actual. Generally, most costly approach from return and fees trade-off viewpoint.
Hybrid/ Bucket Approach	Cheaper than cash flow match Some protection against non-parallel yield curve shifts	Less protection against interest rate risk than cash flow matching approach. In terms of return and fees trade off, in between duration matching and cash flow matching.

A hybrid/bucket approach combines the merits of duration matching (low cost effective matching of interest rate risk) with cashflow matching. It 'buckets' obligations into various tranches and builds an asset portfolio that has expected cashflows that are substantively similar to each 'bucket'. Relative to duration matching, it improves the robustness of the interest rate matching, but is not as precise as a cashflow matching approach.

A hybrid/bucket approach is generally more costly to implement and administer than duration matching approaches, but has the added benefit of matching convexity risk more closely than duration matching. Convexity risk is the risk of non-parallel shifts in the yield curve and is most

©2017 MERCER (CANADA) LIMITED

pronounced when unusual changes in yields happen. While we acknowledge that a hybrid/bucket approach more precisely immunizes convexity risk, we also observe that:

1. Convexity risk is generally equally likely to result in a gain or a loss to an investor, and
2. Gains/losses resulting from non-parallel shifts often works themselves out over modest periods of time.

For investors with very limited tolerance for risk over the short term and sufficient scale to warrant a sophisticated matching program, we support a hybrid/bucket approach and/or a cashflow matching approach. But for investors who can tolerate modest levels of risk over the short term and target excess returns from active management, we are comfortable recommending a duration matching approach which allows for more efficient implementation and a broader opportunity set.

©2017 MERCER (CANADA) LIMITED

5
PUB ORDER 11.21

11.21 Would our modelling and recommendation for the asset mix backing RSR have differed if the upper limit for the RSR was reduced from $438Million to $325Million, as per PUB order 130-17?

Our analysis and eventual recommendation for the assets backing RSR obligations holds so long as MPI's risk tolerance is moderate and the total assets of MPI are in the $2-4Billion range. In other words, our recommended asset mix for RSR would have been the same whether the RSR maximum limit was $438Million or $325Million.

3

ADDRESS PHASE THREE CAC RECOMMENDATIONS

Provide responses to the recommendations made by the CAC as per Schedule G of the RFP.

1. Clarify of Accounting Choices
2. Adoption of More Comparable Accounting Principles
3. AFS and HTM Accounting
4. Pension Liability Accounting
5. Risk/Return Definitions for Asset Mix Decisions
6. De-Linking Discount Rates
7. Min/Max Asset Class Constraints
8. Evolved Risk Framework
9. Explicit Risk Management Goals
10. Minimum Risk Portfolio
11. Canadian Equities Minimum Asset Allocation
12. No International Equities
13. No Over-Reliance on Quantitative Modeling
14. Exclusion of Real Return Bonds
15. Effectiveness of Duration Policy
16. Integration of real estate/infrastructure liabilities in duration management
17. Remove of 105% Rule in Investment Policies
18. Pension Fund

©2017 MERCER (CANADA) LIMITED

CAC RECOMMENDATIONS 1, 2 AND 3:

1. ***Clarity of Accounting Choices****: MPI should clarify what flexibility it has regarding the accounting for assets and liabilities, while remaining GAAP-compliant, and the factors it takes into account in electing to use one method/assumption over others.*

2. ***Adoption of More Comparable Accounting Principles****: In measuring its investment portfolio and liabilities, MPI should consider adopting accounting principles, where GAAP allows MPI to make such elections, that reduce the discrepancy between net income and comprehensive income (as these terms are currently defined by MPI), to improve comparability across all assets as well as liabilities. Comparability would be improved, for example, by accounting for more assets in a way that is consistent with the treatment of financial assets and liabilities at fair value through profit or loss ("FVTPL").*

3. ***AFS and HTM Accounting****: Unrealized gains and losses for AFS assets (~ 20% of assets), for example, are reported as "other comprehensive income (OCI)" and are excluded from net income until realized, making the net income recognition for unrealized gains on equities (~ 18% of assets) inconsistent with FVTPL assets. The treatment of HTM Bonds (25%), recorded at amortized cost, should also be reconsidered.*

From Mercer's perspective, each of these items are accounting specific decisions which should be decided by MPI in consultation with its auditors. We support the utilization of accounting principles that improve transparency and comparability.

©2017 MERCER (CANADA) LIMITED

CAC RECOMMENDATION # 4

4. *Reconsideration should also include the re-measurement of employee benefits (~ 15% of liabilities and equities) which is considered OCI. The re-measurement of employee benefits is large (given the long duration of pension liabilities), but OCI arising from changing interest rates that impact the value of pension liabilities is not recognized through transfers to net income under current practices.*

Background

Currently, MPI commingles the assets of the three lines of business (Basic, Extension and Special Risk Extension ("SRE")), the Rate Stabilization Reserve ("RSR") and its employee pension plan (the "components").

As per the Actuarial Valuation Report as at December 31, 2016 – Pension Liabilities of Manitoba Public Insurance (As a result of participation of its employees in the Civil Service Superannuation Act):

> *"At present, MPI is contributing to the CSSF based on the pay-as-you-go method of funding. Under this method, no advance funding payments for the employer share of the cost of pensions are made to the CSSF. MPI has, however, established a reserve against general assets which is being increased to match the increase in its pension liabilities."*

As per Note 16 of MPI's Annual Financial Statements for the Fiscal Year Ended February 28, 2017 ("MPI 2017 Annual Report"):

> "*The Corporation has not segregated investment assets to fund the benefit plans. Funding occurs as benefits are paid. The Corporation has established a provision against general assets, which is being increased to match the increase in its benefit plan liabilities."*

The current approach to Pension Fund assets is as follows:

1. The accounting basis liability for MPI's pension obligations is calculated by an independent actuary in accordance with International Financial Reporting Standards – International Accounting Standard 19 ("IAS 19").

2. An amount equal to 1. is carved out of the commingled assets and is assigned as pension assets supporting the liability determined in 1.

MPI's pension obligations increase with service cost and interest cost, decrease by benefits paid, and are re-measured to reflect membership experience and changes in economic and demographic assumptions. In accordance with IAS 19, MPI recognizes:

©2017 MERCER (CANADA) LIMITED

- service cost and interest cost in a fiscal year as an expense in its Statement of Operations (i.e., profit and loss); and

- the impact of re-measurement of the its pension obligations in Other Comprehensive Income ("OCI").

As per Note 21 of MPI's Annual Financial Statements for the Fiscal Year Ended February 28, 2017 ("MPI 2017 Annual Report"), re-measurement of employee future benefits will not be reclassified to income.

Observations

As per the Basis for Conclusions BC90 of IAS 19 – Employee benefits (revised 2011),

> *"In finalizing the amendment made in 2011, the Board confirmed that the proposal made in the 2010 ED that an entity should recognize remeasurements in other comprehensive income. The Board acknowledged that the Conceptual Framework and IAS 1 do not describe a principle that would identify the items an entity should recognize in other comprehensive income rather than in profit and loss. However, the Board concluded that the most informative way to disaggregate the components of defined benefit cost with different predictive values is to recognize the remeasurements component in other comprehensive income."*

MPI's current process for recognizing changes in its pension obligation is consistent with IAS 19. Service cost represents the present value of the defined benefit obligation resulting from employee service in the fiscal period and interest cost represents the interest earned in the fiscal period on the present value of the defined benefit obligation for accumulated employee service at the beginning of the fiscal period. Service cost and interest cost together can be viewed as representing costs associated with the pension obligation during a fiscal period.

However, pension obligations are long-term in nature, and the valuation of those obligations depends on many assumptions (e.g., interest rates used to determine the liability, rates of inflation and pensionable earnings, longevity of current and future retirees, rates of retirement, termination of employment and disability). Some of the assumptions used to determine the liability can experience short-term fluctuations (e.g., discount rate) that may result in significant short-term gains or losses. In addition, membership experience may be different than expected and result in gains and losses. The effects of re-measurements on the pension obligations are not within the direct control of MPI.

Regardless of MPI's practice to not reclassify the re-measurement of employee future benefits as income, MPI's current process still results in a provision against general assets that is reset to match the total re-measured defined benefit obligations.

©2017 MERCER (CANADA) LIMITED

Recommendation

Given the above observations and assuming that MPI will continue to maintain its pension obligations indefinitely and will continue with its current policy with respect to the pay-as-you-go method of funding, our recommendation is that re-measurement of employee benefits continue to be recognized in OCI and not reclassified to income.

CAC RECOMMENDATION # 5

5. "MPI should re-define return/risk used to inform its long-term asset mix decisions to be based on valuations that reflect market values, rather than accounting ones (which may be materially different). At a minimum, net income should be replaced by comprehensive income in the numerator (return) and retained earnings should be expanded to include accumulated other comprehensive income (AOCI) in the denominator (risk). In the long term, market returns and market risks will determine average long-term premium rates, regardless of how assets and liabilities are accounted for under GAAP."

RESPONSE

We agree that asset mix decisions should be based on market values. The 2017 asset liability study is based on market values.

CAC RECOMMENDATION # 6

6. ***De-Linking Discount Rates****: For purposes of long-term asset allocation decision making, MPI should consider "breaking the link" (recursive) between liability valuations and the yield on some of its assets. Economic theory suggests this approach is more appropriate.*

We agree with the CAC recommendation for the purpose of long-term asset allocation decision making. Further, the asset/liability study, which we understand will be used by MPI in connection with its long-term asset allocation decision making, was performed in a manner where current economic assumptions for each asset class (e.g., rates of return, standard deviations, correlations, etc.) were determined independently of MPI's current asset holdings. The asset/liability study did consider a liability benchmark portfolio for each of MPI's lines of business and other metrics.

CAC RECOMMENDATION #7

7. *"The minimum/maximum and other constraints imposed on the portfolio (e.g., when asset-liability studies are conducted) should be reviewed and relaxed, to avoid costly constraints (lower risk-adjusted returns). The rationale for imposing any such constraints should be made explicit."*

The 2017 Asset Liability Study will develop optimal asset allocations on both a minimally constrained and constrained basis. The minimally constrained basis considers the fact that MPI requires a reasonable level of investment liquidity to ensure cash is available to pay claims or

©2017 MERCER (CANADA) LIMITED

pension benefits. The constrained basis will employ practical implementation considerations that cannot be modelled without constraints. Each of these constraints will be clearly documented and explained. For example MUSH bonds will have a minimum constraint as these bonds are not liquid and over the foreseeable future an allocation to MUSH will remain even if the study's results were to conclude that MUSH bonds should be eliminated.

RECOMMENDATION

The Asset Liability Study will review both minimally constrained and practical implementation constraints that will be well documented and explained.

CAC RECOMMENDATION # 8

8. ***Evolved Risk Framework****: An evolved risk framework should be considered to improve portfolio/risk measurement, management and/or governance.*

We agree that well thought-out risk frameworks can contribute significantly to better risk management, risk management, and governance decisions. The asset/liability study, and the proposed segregation of assets by business line, further allows a risk management framework to add value. From our perspective, it is important that a risk management framework focus on metrics that matter and emphasize process, reporting, and accountability. We would be pleased to provide further guidance on an appropriate risk framework for MPI in the future.

CAC RECOMMENDATION # 9

9. ***Explicit Risk Management Goals****: Among other things, the risk framework could include explicit goals related to market risk management (as well as goals related to other types of risk if those require enhancement). One goal might be to avoid "undue risk", which is risk that is taken:*

    - *unknowingly, not having been identified (unaware); or*
    - *knowingly, but which:*
        - *cannot be managed prudently, given current capacities (ineffective);*
        - *exceeds risk tolerances (prohibited);*
        - *is higher than it needs to be (inefficient); or*
        - *is not understood (uninformed).*

    Another goal might be to get paid better/well for those risks that are desired, with incentive systems that encourage desired behaviours that achieve desired outcomes and controls that monitor compliance with limits that discourage/prevent undesired behaviours and prevent undesired outcomes.

We agree that explicit goals related to market risks are desirable. The asset liability study helped clarify the amount of credit, equity, and other risks that MPI was willing to take for each business.

The exploration and articulation of undue risks was beyond the scope of the asset liability study, and often extends to a discussion of operational and non-market risks. From our experience, such frameworks take significant time to develop, and are not always implemented effectively. We would be pleased to discuss further in the future.

©2017 MERCER (CANADA) LIMITED

CAC RECOMMENDATION # 10

10. ***Minimum Risk Portfolio**: A minimum risk portfolio (for market risk) should be clearly defined. It should be aligned with the interests of relevant stakeholders, with clarity regarding the short-term and long-term factors that impact rate sustainability and other important outcomes.*

The minimum risk portfolio (for market risk) is a portfolio of federal Canadian bonds with a duration that is similar to that of MPI's market liabilities. A laddered portfolio of federal Canadian bonds is assumed to have 'minimum risk' since there is assumed to be no default risk and no convexity risk (dollar matched) and limited amounts of liquidity risk. Provincial bonds, corporate bonds, MUSH bonds, and Private Debt all include various levels of credit risk and liquidity risk.

The minimum risk portfolio for MPI's Basic Liabilities assuming 2% inflation on a go-forward basis consists of:

CATEGORY	% ALLOCATION
Federal Long Term Bonds	54%
Federal Mid-Term Bonds	18%
Federal Short-Term Bonds	28%

A minimum risk portfolio that hedges inflation risk would also include an allocation to federal Real Return Bonds.

CAC RECOMMENDATION # 11

11. "*The appropriateness and prudence of having a 10% minimum weight to Canadian Equities ("to retain a meaningful exposure to home markets") should be reconsidered, given the different interests of different stakeholders (e.g., employees through the pension plan), the concentrated nature of Canada's equity market, and other such relevant considerations."*

ANALYSIS

Based on the MPI investment policy statement effective April 27, 2017, the asset allocation for Canadian equity has a policy weight of 10%, which is 67% of the 15% total policy allocation to public equities. Most institutional investors have significantly diversified their public equity portfolios such that allocations to Canadian equities are typically between 25% to 33% of total public equities. Such allocations still represent a modest home country bias (since Canadian equities are ~ 4-5% of total global equities), but are much more diversified than the current MPI allocation. Some Canadian institutional investors have completely eliminated any home country bias.

Investors who choose to maintain a healthy home country bias typically do so because of inertia, lower investment management fees, to reduce currency risks, or since correlation with Canadian

©2017 MERCER (CANADA) LIMITED

inflation is slightly higher than for non-Canadian equities. Overall, we view the diversification benefits of a globally diversified public equity portfolio to be compelling.

IMPLEMENTATION CONSIDERATIONS

The 2017 Asset Liability Study will review the expansion of the equity portfolio to consider:

1. EAFE[1] Equities (often referred to as International Equities) which represents approximately 36% of the developed world's capital markets.

2. Global Low Volatility Equities which are global equity mandates that target between 20% - 30% reduction in return volatility as compared to the MSCI Global Equity Index.

RECOMMENDATION

We expect our recommendation will be to reduce the allocation of Canadian equities to be 25-33%[2] of total public equities.

CAC RECOMMENDATION # 12

12. *"The appropriateness and prudence of having no exposure to International Equities should be reconsidered, given the large size of non-US foreign markets, the return opportunities that are potentially available from those missed opportunities and the effects of increased international diversification on long-term market risks."*

ANALYSIS

As part of the Asset Liability Study conducted by Mercer in late 2017, the asset allocation policy is being revisited. To date, the review has discussed the relatively concentrated nature of Canada's equity market. The aim of the asset allocation policy review is to develop an asset allocation policy that is optimal in light of the appropriate level of risk. EAFE[3] Equities (often referred to as International Equities) represents approximately 36% of the developed world's capital markets. We fully support reviewing the diversification of the equity portfolio by including International Equities.

IMPLEMENTATION CONSIDERATIONS

Transitioning to a non-Canadian equity portfolio is relatively straightforward, particularly if suitable pooled funds are available

The alternative to optimizing allocations to US Equity and EAFE Equity is to bundle these two mandates into one mandate (typically referred to as 'global equities' and typically benchmarked to

---

[1] Europe Australasia Far East as defined by investment industry wide used benchmark provider MSCI.

[2] Based on no constraints on allocations to Canadian equity.

[3] Europe Australasia Far East as defined by investment industry wide used benchmark provider MSCI.

©2017 MERCER (CANADA) LIMITED

the MSCI World index). This is supported by the fact the lines are blurred when it comes to categorizing a stock as US Equity or EAFE Equity when you consider the level of corporate globalization. For example, categorizing Microsoft as US Equity and ignoring it's non-US operations does not make sense. At the same time, combining the mandates into one mandate allows the investment manager to select a best in class stock regardless of questionable geographical classification. This in turn, provides the manager with an additional lever to outperform market returns. An extension of this idea is to combine US Equity, EAFE Equity and Emerging Markets equity into a single mandate known as an All Country mandate, which is typically benchmarked to the All Country World Index ("ACWI"). ACWI mandates are currently composed of about 52% US, 32% EAFE, and 12% Emerging Markets Equities. Note that the decomposition of ACWI into geographical regions is considered irrelevant to many ACWI investment managers, given the level globalization present in the world. Also, note that Emerging Markets Equities include companies such as Samsung, TenCent and Alibaba (all of which have a market cap of over $200Billion).

RECOMMENDATION

We expect our recommendation to include an allocation to international equities. Note that the 2017 Asset Liability Study will not constrain the allocation to international equities.

CAC RECOMMENDATION # 13

13. ***No Over-Reliance on Quantitative Modeling****: MPI should be vigilant about its potential over-reliance on quantitative considerations, given the high sensitivity of optimal asset allocations to seemingly small changes in capital market assumptions (returns, volatilities and correlations) and the large number of inputs.*

While quantitative models can be instructive and useful, we very much agree that investors should never rely solely on quantitative modeling for the reasons noted. While our Asset Liability process began with projections of a variety of asset classes and assumption sets, it concluded with a thorough discussion of practical considerations and observations regarding the current market environment.

CAC RECOMMENDATION # 14

14. *"The role that RRBs can play in effectively managing relevant risks should be discussed, with consensus achieved regarding the effectiveness of RRBs from a risk management perspective (i.e., independent of the cost of any "insurance" as measured by RRB yields and their expected returns)."*

Real Return Bonds ("RRBs") have the components of a conventional bond, coupon payments and return of principal at maturity. The distinguishing feature of the RRB is that both the periodic coupon payments and the return of principal at maturity are linked to the consumer price index ("CPI") over the respective term. The real yield (i.e., the yield in excess of CPI) is known at date of issue. The

©2017 MERCER (CANADA) LIMITED

coupon payments and adjusted principal repayment depend on future inflation. This makes RRBs an explicit hedge against inflation risk.

The inflation sensitivities of MPI's three lines of business (Basic, Extension and Special Risk Extension ("SRE")), the Rate Stabilization Reserve ("RSR") and its employee pension plan ("MPI components") measured by duration are summarized in the table below:

Item	Basic	Extension	SRE	RSR	Pension
Sensitivity to Inflation Rate Changes (Duration[3])	10.4[2]	0.0[2]	0.0[2]	0.0[2]	12.6[1]

Duration is a measure of interest rate sensitivity. A real duration of 10 means a 1% decrease (increase) in the real interest rate used to calculate the liability will result in a 10% increase (decrease) in the liability. The duration of Canadian RRB market is currently approximately 15. Hedging a duration of 10 would simply mean having a 66%[4] allocation to RRBs.

ANALYSIS

RRBs are the most direct hedge to inflation, but provide no opportunity for additional real returns. Investors looking to balance return enhancement with inflation hedging often look to obtain an implicit or indirect inflation hedge using real assets, which are expected to deliver inflation sensitive returns (e.g., physical[5] real estate, physical infrastructure).

The Canadian RRB market is fairly large and liquid. There are currently 15 outstanding issuances, among which eight were issued by the Government of Canada and 7 are provincial issuances.

RRBs issued by the Government of Canada are the most liquid and currently have a total market value of about $72 Billion.

IMPLEMENTATION CONSIDERATIONS

Typically, RRB investment mandates are best handled by a passive manager with significant assets in RRBs relative to peer managers as this could aid in sourcing the less liquid RRB issues. These

[4] FTSE TMX RRB Index has a duration of about 15; whereas the MPI Basic liabilities have a real duration of about 10. This means a 66% RRB allocation would provide a real duration of 10 (i.e., 66% x 15 = 10).

[5] Physical real estate investment means actually investing in a physical property that produces income and capital gains or losses. This should not be confused with real estate investments that invest in the stocks of real estate companies.

©2017 MERCER (CANADA) LIMITED

passive managers provide broad RRB market exposure at fee levels significantly lower than conventional bond mandates.

Due to the limited number of RRB issues and their specific maturity dates, developing a portfolio to match the inflation risk in the MPI components can be challenging. The challenge arises from trying to achieve a closely matching inflation-sensitive cash flow between assets and the respective component's projected claims or pension payments.

RECOMMENDATION

We agree that RRBs can provide an effective hedge against CPI linked obligations. MPI approved the inclusion of RRBs in the 2017 Asset Liability Study. However, given low current inflation expectations it was decided to assume that CPI linked obligations grow at 2% per annum and hedge nominal, but not real, interest rate risk. Accordingly, RRBs were not included in the recommended portfolio.

CAC RECOMMENDATION # 15

15. *"The effectiveness of the duration policy should be reviewed, given the inherent risks of changing real interest rates and unexpected inflation arising from MPI's liabilities, and exposure to changes in nominal interest rates in the MPI portfolio (i.e., nominal bonds without inflation protection). More specifically, MPI should re-assess the effectiveness of its duration-matching strategy since inflation (actual and/or expected) may differ from current expectations."*

In Phase 1 of our analysis, we contrasted 3 approaches that institutional investment managers utilize to manage interest rate risk:

Approach	Pros	Cons
Duration Matching	Cost effective approach. Protects against parallel shift in yield curve. Provides more flexibility with regard to investment vehicles, particularly if return enhancement is a priority.	Does not protect as well against non-parallel shifts in comparison to other approaches.
Cash Flow Matching	Higher resolution matching Protects against reinvestment risk, including non-parallel yield curve shifts	Precision of claims/benefits projections may not merit high resolution matching, as projected cash flows can be materially different from actual. Generally, most costly approach from return and fees trade-off viewpoint.

©2017 MERCER (CANADA) LIMITED

Hybrid/ Bucket Approach	Cheaper than cash flow match Some protection against non-parallel yield curve shifts	Less protection against interest rate risk than cash flow matching approach. In terms of return and fees trade off, in between duration matching and cash flow matching.

A hybrid/bucket approach combines the merits of duration matching (low cost effective matching of interest rate risk) with cashflow matching. It 'buckets' obligations into various tranches and builds an asset portfolio that has expected cashflows that are substantively similar to each 'bucket'. Relative to duration matching, it improves the robustness of the interest rate matching, but is not as precise as a cashflow matching approach.

A hybrid/bucket approach is generally more costly to implement and administer than duration matching approaches, but has the added benefit of matching convexity risk more closely than duration matching. Convexity risk is the risk of non-parallel shifts in the yield curve and is most pronounced when unusual changes in yields happen. While we acknowledge that a hybrid/bucket approach more precisely immunizes convexity risk, we also observe that:

1. Convexity risk is generally equally likely to result in a gain or a loss to an investor, and
2. Gains/losses resulting from non-parallel shifts often works themselves out over modest periods of time.

For investors with very limited tolerance for risk over the short term and sufficient scale to warrant a sophisticated matching program, we support a hybrid/bucket approach and/or a cashflow matching approach. But for investors who can tolerate modest levels of risk over the short term and target excess returns from active management, we are comfortable recommending a duration matching approach which allows for more efficient implementation and a broader opportunity set.

CAC RECOMMENDATION # 16

16. *"MPI should consider the liabilities arising from all sources (i.e., including real estate and infrastructure) in its interest rate risk management practices (duration), to be consistent with its management of risks arising from insurance, pension and other liabilities. The financial leverage assumptions used in Asset-Liability Studies that support long-term asset mix decisions should be made consistent with the leverage actually used in the portfolio, removing the ~ 4% difference related to real estate debt."*

MPI's real estate investment is a direct investment in property, as opposed to an investment in real estate corporation stocks. Similarly, MPI's infrastructure investment is direct rather than investing in infrastructure corporations.

©2017 MERCER (CANADA) LIMITED

ANALYSIS

While it is true that interest rate risk exists in Real Estate and Infrastructure, we suspect that the duration will be relatively short when compared to MPI liabilities as debt terms in these investments can be short in term and interest rates can be floating. As such, it is extremely rare to consider duration risk of the underlying liability in these investments.

The following illustration provides a sense of the level of materiality:

Target Allocation to Real Estate	10%
Leverage used in Greystone real estate fund	25%
Assumed Duration of Debt	4*
Duration of Real Estate as a portion of overall MPI portfolio	0.10

*** Provided by Greystone on October 27, 2017.**

Analysis as at June 30, 2017

RECOMMENDATION

The Asset Liability Study will consider the use of leverage in the Real Estate and Infrastructure and how it may influence the overall duration of the portfolio. At this point, we do not expect it to be material nor worthy of hedging.

CAC RECOMMENDATION # 17

17. *Removal of 105% Rule in Investment Policies: MPI should remove from its Investment Policies the ability to request external managers to realize gains (losses) ("105% Rule"), which MPI says "is no longer relevant". This would remove an ability by MPI to cause a manager to realize gains (losses) for the sole purpose of having an impact on net income, without yielding any economic value, reducing risk or otherwise conferring another benefit on MPI.*

We generally support investment policies that are in the long term best interest of the ultimate beneficiary. Unless this rule mitigates taxation or other undesirable consequences, we support its removal.

CAC RECOMMENDATION # 18

18. *"The interests of all relevant stakeholders should inform decisions regarding both the accounting for and management of the assets and liabilities related to the pension plan and other employee benefits. A desirable outcome is to have greater clarity around the appropriateness and prudence of maintaining different types of assets and liabilities commingled in one fund."*

Currently, MPI commingles the assets of the three lines of business (Basic, Extension and Special Risk Extension ("SRE")), the Rate Stabilization Reserve ("RSR") and its employee pension plan (the "components").

©2017 MERCER (CANADA) LIMITED

As per the Actuarial Valuation Report as at December 31, 2016 – Pension Liabilities of Manitoba Public Insurance (As a result of participation of its employees in the Civil Service Superannuation Act):

> *"At present, MPI is contributing to the CSSF[6] based on the pay-as-you-go method of funding. Under this method, no advance funding payments for the employer share of the cost of pensions are made to the CSSF. MPI has, however, established a reserve against general assets which is being increased to match the increase in its pension liabilities."*

As per Note 16 of MPI's Annual Financial Statements for the Fiscal Year Ended February 28, 2017 ("MPI 2017 Annual Report"):

> *"The Corporation has not segregated investment assets to fund the benefit plans. Funding occurs as benefits are paid. The Corporation has established a provision against general assets, which is being increased to match the increase in its benefit plan liabilities."*

The current approach to Pension Fund assets is as follows:

1. The accounting basis liability for MPI's pension obligations is calculated by an independent actuary in accordance with International Financial Reporting Standards – International Accounting Standard 19.

2. An amount equal to 1. is carved out of the commingled assets and is assigned as pension assets supporting the liability determined in 1.

Under the current approach, where the performance of commingled assets differs from the change in pension liabilities, a gain (or loss) is incurred by the commingled fund and impacts the assets remaining for other Components. The primary economic drivers of changes in pension liabilities are changes in long-term interest rates and inflation expectations. For example:

- a decrease in applicable interest rates will increase the size of the pension liabilities, which in turn will increase the size of the provision against general assets; and
- an increase in applicable interest rates will decrease the size of the pension liabilities, which in turn will decrease the size of the provision against general assets.

As part of the Asset Liability Management Study conducted by Mercer in late 2017, the objectives, risk tolerances, and characteristics of each liability, including pension liabilities, were assessed separately. The study recommended a shift away from commingled assets to individual target asset

[6] CSSF is the Civil Service Superannuation Fund.

©2017 MERCER (CANADA) LIMITED

mixes for the pension liabilities and other lines of business. Once implemented, assets backing pension obligations will no longer be commingled with the assets backing MPI's other obligations.

Introduction

The Corporation currently has a single commingled investment portfolio that backs all Corporate liabilities and surplus, which includes liabilities from Basic claims, Extension, SRE, RSR, and Employee Future Benefits (EFB, which is primarily pension). As a result of the ALM study that was recently completed the corporation will develop five segregated investment portfolios backing the various liabilities, each with unique asset allocations. This will allow the corporation to develop investment portfolios that better match the associated liabilities. Segmenting the portfolios by line of business will provide a better understanding of changes in the value of the liabilities and the associated assets. This will enable MPI to optimize each investment portfolio to best match the associated liability.

The portfolio backing the Basic claims will consist of 100% fixed income while the portfolios backing Extension, SRE & RSR will be balanced (50% growth assets/50% fixed income assets) and the portfolio backing EFB will have a slightly higher allocation to growth assets at 60%. Currently, the portfolios recommended for RSR, Extension & SRE have the same asset allocations (50/50 growth/fixed income), but because the portfolios are unique (ie: no assets shared between them) the asset allocations can be changed in the future if necessary. On a consolidated basis the portfolio will have an 84%/16% split between fixed income and growth assets as compared to the current 70%/30% split.

From an overall perspective, this will require selling growth assets (equities, real estate & infrastructure) in order to purchase additional fixed income assets. The transition is expected to be completed by Q4 2019/20 as illiquid asset classes such as real estate and infrastructure must be partially sold, and the proceeds of MUSH maturities will be used to fund the purchase of asset classes such as corporate bonds, private debt, global equities and global low volatility equities. Manager searches must be conducted and accounting systems and processes must be redesigned to accommodate segregation.

Process

The ICWG worked closely with the team from Mercer throughout the ALM study. Several in person meetings and conference calls were held with Mercer to provide them with direction. In addition, the Investment Department had weekly project management calls to track progress of the work and was in regular contact with key members of Mercer's team.

The following meetings were held:

1. Reviewed project plan on October 2, 2017
2. Kick-off call on October 11, 2017
3. Discussion of Phase One Report on October 31, 2017
4. Mercer presented to the Investment Committee on November 16, 2017 and
5. Phase Three Report presented November 27, 2017 to IC & ICWG
6. Mercer presented to the Investment Committee on December 8, 2017.

The topics discussed in Phase One were:

1. Merits of adopting unique asset allocations,
2. Merits of new fixed income exposure,
3. Assessment of interest rate risk management strategy,
4. Address certain CAC recommendations.

After Phase One, MPI management decided to adopt a unique portfolio for each liability and classes to include. In Phase Two, Mercer began developing efficient frontiers for each portfolio which identified the optimal asset allocation at each level of risk. The current asset allocation was plotted relative to the efficient frontier and portfolios with the same risk and same return as the current portfolio were identified as starting points. Then the risk appetite of the corporation was used to guide the selection of the most appropriate portfolio.

A key decision was that the nominal interest rate risk associated with the Basic claims liabilities must be fully hedged. This lead to the decision to eliminate all growth assets from the portfolio backing the Basic claims liabilities. The result was a portfolio consisting of only fixed income assets.

Benefits to MPI

The proposed changes to the Corporate investment portfolio, segregation by lines of business, and the changes to accounting systems are significant. However, if the proposed implementation plan outlined in this document is approved, by the end of 2019/20 the overall risk of the Corporation's consolidated investment portfolio will be reduced with improved interest rate matching for Basic and increased transparency for all lines of business.

Technical Conference

On March 14th, 2018 the Public Utilities Board (PUB) facilitated a technical conference on the ALM study. The concepts and details of the ALM study were generally well received by those in attendance. The primary concern of the PUB advisors and interveners related to the level of detail and analysis that was included in the three ALM reports. The PUB expects to see the details of the assumptions supporting the analysis, the efficient frontiers, and options considered along the frontiers, and additional justification for the duration matching approach.

The Consumers' Association of Canada (CAC) was also focused on the assumptions adopted by Mercer, particularly the interest rate forecast, and inflation correlations, as well as the risks associated with a heavy emphasis on fixed income, and that the foregone returns to ratepayers are balanced with the resulting reduction of risks. MPI will file additional material supporting the conclusions of the ALM study in the 2019 GRA.

1) Number of Unique Portfolios

The decision to segregate the portfolio into unique asset allocations was approved at the December 2017 Investment Committee meeting.

MPI management recommends five unique portfolios, each supporting a single liability. Segregating the portfolios will allow investment strategies to be tailored to each individual line of business based upon their own characteristics and risk profiles and will reduce the need for allocations. The rationale behind the recommendation to have five unique portfolios is to find a balance between maximizing transparency for the major lines of business without unnecessarily increasing management and custodial costs[1] and administrative work with a more complicated portfolio structure.

The five portfolios will support the following liabilities:

1. Basic Claims
2. Basic RSR (no actual liability)
3. Employee Future Benefits (primarily pension)
4. Extension (claims and retained earnings)
5. SRE (claims and retained earnings)

2) Changes to Asset Classes

New Asset Classes

The following three asset classes are recommended to be added to the consolidated portfolio.

1. Private Debt
2. Global Equities
3. Low Volatility Global Equities

The addition of these asset classes will improve diversification which will increase return and reduce risk. Additional information on each is provided in the appendices to this document.

[1] RBC Investor Services indicated that there would not be any additional charges to set-up the new custody accounts. The same safekeeping & transaction fee's that are currently being paid would apply to the new accounts, and the fee would be allocated accordingly based the assets and activities in each account. The only changes to the annual cost would result from a change in asset level or account activity. See Appendix H for the fee schedule.

1) Private Debt

See Appendix A for the complete recommendation on Private Debt.

Mercer's recommendation is for North American investment grade private debt with a proposed target allocation of 15% private debt for Extension, SRE, and RSR. Employee Future Benefits (EFB) has a 20% proposed allocation. MPI management supports this recommendation because private debt provides yield enhancement and diversifies the credit risk of the current fixed income portfolio. Drawbacks are that the asset class is illiquid, issues are generally unrated and Canadian based funds are relatively new, indicating that this is a new asset class.

MPI management recommends investing in an open ended pooled funds rather than through closed ended limited partnerships. Open ended pooled funds provide easier access to the asset class, with diversification after initial investment. Most open ended private debt funds provide daily Net Asset Values and monthly liquidity

2) Global Equities

See Appendix B for the complete recommendation on Global equities.

Mercer recommended a Global Equity strategy that includes emerging markets to replace the U.S. equity portfolio. Investing in Global equities is a reflection of an integrated global economy and it increases the opportunity set.

However, MPI management recommends a global equity strategy that excludes exposure to emerging markets. Historical returns for the MSCI All Country World Index (MSCI ACWI) (which includes exposure to emerging markets) and MSCI Global indices showed that adding exposure to emerging markets does not improve risk adjusted returns. Further, there are potential concerns about investing in the emerging market countries.[2]

The S&P 500 had better historical performance relative to the MSCI World Index over the last 20 years. Therefore, the recommendation to replace the U.S. equity mandate with an international equity mandate is not based on historical performance, but instead is based on theory. Investing in international equities will improve diversification of the existing equity portfolio and increase the available opportunity set.

According to the Pension Investment Association of Canada (PIAC), within Canadian pension plans the average allocation to Global Equities is 19.9% while Canadian equities have an average allocation of 7.2%. U.S. equities has an average allocation of 3.3% and emerging markets have an average allocation of 3.0%. Based on this information, Canadian pension plans have significant exposure to global equities and minimal exposure to U.S. and emerging market equities.

[2] The emerging markets are: Brazil, Chile, China, Colombia, Czech Republic, Egypt, Greece, Hungary, India, Indonesia, Korea, Malaysia, Mexico, Pakistan, Peru, Philippines, Poland, Russia, Qatar, South Africa, Taiwan, Thailand, Turkey and the United Arab Emirates.

Exchange rate volatility does not add significant risk to a global equity portfolio over the long-term[3] (table below) as there is expected to be offset between the various currencies over time. Currency exposure actually provides diversification benefits to a global equity portfolio as the underlying equity returns are generally much more volatile than the exchange rates. U.S. and domestic companies are not without risk as they have indirect currency exposure that is difficult to measure and hedge.

Figure 1: EAFE Unhedged vs Hedged

Jan. 1990 – May 2015

	EAFE Unhedged	EAFE Hedged
Average Annualized Return	6.34%	5.65%
Compound Annualized Return	4.95%	4.57%
Standard Deviation	17.21%	15.18%
Sharpe Ratio	0.20	0.18

Sources: MSCI, Gerstein Fisher Research

3) Global Low Volatility Equities

See Appendix C for the complete recommendation on Global Low Volatility equities.

Low volatility strategies are designed to have less volatility than comparable market capitalization weighted strategies. These strategies are based on historical volatility. Volatility and other risk measures are used to determine the weighting of individual stocks in the portfolio.

MPI Management recommends a global equity low volatility strategy that excludes emerging markets. Based on historical data, combined exposure to both Global equities and Global Low Vol provides diversification benefits, higher risk-adjusted returns and lower volatility compared to a core Global Equity mandate only.

Changed Asset Classes

1) Provincial Bonds

Mercer recommended investing the marketable bond portfolio primarily in provincial bonds in order to increase the yield of the fixed income portfolio relative to holding federal bonds. This recommendation is an attempt to optimize the fixed income yield, and MPI management agrees with this recommendation.

Changing the asset category from government bonds to provincial bonds does not mean that the bond manager may not hold federal or municipal bonds, but the benchmark will be Provincial

[3] *To Hedge or Not to Hedge: Currency Hedging and International Investing, Gerstein Fisher, 2015 and Currency Hedging over long horizons*, Kenneth A. Froot, National Bureau of Economic Research, 1993

bonds. The manager will have some discretion to deviate from the benchmark in order to add value, while ensuring that the portfolio is dollar and duration matched to the Basic claims liabilities in order to ensure that nominal interest rate risk is minimized.

2) Corporate Bonds

Mercer recommended 18.6% total portfolio exposure to corporate bonds, which is approximately 22% of the total fixed income portfolio. Mercer recommended a 20% allocation to corporate bonds for the portfolio supporting the Basic Claims liabilities, a 10% allocation for Extension, SRE and RSR, and a 20% allocation for Employee Future Benefits.

These asset allocations were the result of the stochastic modeling completed by Mercer and the optimal portfolios identified for each line of business, employee future benefits and RSR. Mercer's consolidated portfolio allocation of 18.6% was unrelated to the forecasted 18% target weight for corporate bonds in the 2018 GRA. With the universe for public fixed income restricted to Canadian investment grade debt, corporate bonds (along with provincial bonds) were one of the few opportunities to increase the yield of the fixed income portfolio supporting the Basic claims liabilities.

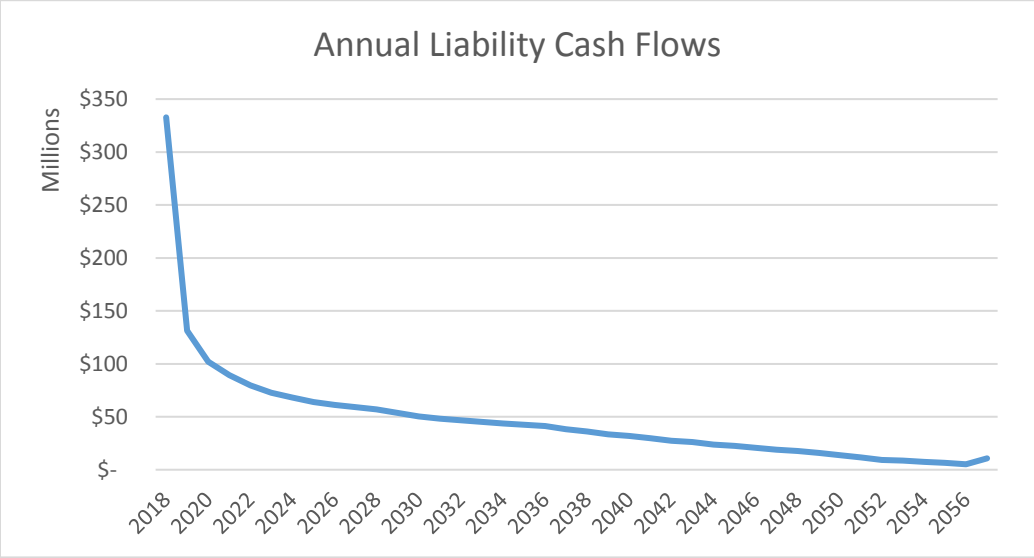
Corporate bonds were recommended in the last two ALM studies by both Aon Hewitt and Mercer. This recommendation is comparable to corporate bond allocations by both SGI and ICBC and in-line with other Canadian P&C insurance companies, as well as the FTSE TMX Universe Bond Index (see Appendix D for more information). The risks related to corporate bonds and how to manage those risks were discussed at length in submissions to the Investment Committee on June 1, July 27 and November 16, 2017. See Appendix D for more information.

3) Overview of Liabilities and Risk Tolerance

The ICWG worked with assistance from Mercer to determine the risk tolerance of each line of business with direction from the Investment Committee.

Basic Claims Liabilities
Basic Claims Liabilities are subject to significant interest rate risk as the duration of the liabilities is long (9.7 years) and require a high level of liquidity to pay claims. Given that the Basic insurance business comprises approximately 88% of the total business based on net claims incurred, and that no new rates or fees for Basic services can be introduced without the approval of the Public Utilities Board, the risk tolerance for assets supporting Basic is low.

The obligations are a mix of long-term payments (disability claims indexed to inflation) and short-term payments (typically physical damage repairs). The total value of these claims liabilities is approximately $1.8 billion. Claims Liability cashflows by year are depicted in the following chart:



Claims liability estimates have risk from mortality, asset and liability mismatch, investment returns, technological improvements. The actuarial valuation includes an 18.1% ($273 million) risk load to account for these risks.

To meet these objectives and reflect the nature of the Basic claims liabilities, the proposed asset allocation for the assets backing the Basic claims liabilities is to attempt to hedge substantially all nominal interest rate risk by investing in bonds with nominal interest rate duration that matches the duration of Basic liabilities. Given the low tolerance for risk, the proposed asset allocation for the Basic claims liabilities does not include equities or alternative investments.

Rate Stabilization Reserve (RSR)
The RSR is essentially surplus assets including accumulated other comprehensive income (“AOCI”). The intent of the RSR is to protect motorists from rate increases made necessary by unexpected events and

losses arising from non-recurring events or factors. There is no underlying obligation therefore there is no targeted interest rate risk hedge. The size of the RSR dictates the capacity to stabilize rate increases.

While there are no specific underlying liabilities, the RSR is susceptible to volatility in earnings primarily caused by adverse weather such as hail or winter storms; therefore the risk tolerance for RSR is moderate. Given the moderate tolerance for risk, the proposed Policy for these lines reflects a balanced portfolio of bonds, equities and alternative investments. The proposed Policy for RSR includes an allocation to Private Debt which is not included in the more conservative portfolio for the Basic claims liabilities.

Employee Future Benefits

Employee Future Benefits (EFB) support MPI employee pension liabilities in conjunction with MPI's unfunded portion of the Civil Service Superannuation Board of Manitoba ("CSSB") pension obligations, post-retirement benefits and retiring allowance/severance provision. EFB are subject to interest rate risk tied to high quality long-term corporate bond yields (the discount rate for pension liabilities is a function of these yields). The duration of the EFB is long at 15.6 years. Risk tolerance is moderate. CSSB has an asset allocation policy that allocates approximately 30% to bonds and 70% to equities and alternative asset classes. MPI's proposed Policy for the EFB assets is an allocation slightly less aggressive than that of CSSB (40% to bonds and 60% to equities and alternative asset classes).

Employee Future Benefits includes the following items:

Item	Amount (millions)
Pension obligations	$392.7
Post-retirement benefits	$26.8
Retiring allowance/severance provision	$26.9
Total	$446.5

The In-scope post-retirement benefits provide a health spending account. Out of scope post-retirement provides a health benefit plan.

Employees of the Corporation are entitled to severance pay in accordance with the Collective Agreement and Corporate policy. The provision for severance pay is actuarially determined on an annual basis using the projected benefit method prorated on services, without salary projection, which includes the Corporation's best estimates based on assumptions relating to the proportion of employees that will ultimately retire.

4) Recommended Asset Allocations

Current Asset Allocation

The consolidated portfolio asset allocation approved by the Investment Committee on April 27, 2017 is shown below.

Figure 2: Current Asset Allocation in Section 7 of the Investment Policy Statement

Asset Class (Group)	Minimum	Normal	Maximum	Accounting Class**

Cash and short-term	0.0%	0.0%	5.0%	AFS
Fixed Income				
-Government Bonds	40.0%	45.0%	60.0%	FVTPL
-Corporate Bonds	0.0%	5.0%	10.0%	FVTPL

*Total equity and net assets

Considerations for Determining the Asset Allocations

Appendix F shows efficient frontiers from Mercer's Phase Two report, which helped determine the asset allocations for the five segregated portfolios.

MUSH and Private Debt Allocations

MUSH bonds are illiquid and provide a yield premium over listed Province of Manitoba bonds. However, going forward the new issuance of MUSH bonds will be severely limited and therefore new purchases will be minimal. Therefore, private debt was viewed as a partial substitute for MUSH bonds within the non-Basic portfolios as private debt can provide higher yields than government debt.

Private debt was not included in the Basic Claims portfolio in order to limit risk within the portfolio and because including private debt could complicate the duration matching strategy. A significant allocation to MUSH bonds within the bond portfolio supporting the Basic claims liability was made in order to maximize the yield of the portfolio.

Basic Line of Business
The Basic Line of Business will include 100% of the Basic claims and RSR portfolios and approximately 85% of the EFB portfolio. When these portfolios are aggregated for financial reporting purposes the fixed income/growth split for the Basic line of business will be approximately 89%/11%.

Inflation Protection
MPI has a long-term inflation forecast of 2.0%, which is based upon historical inflation and the Bank of Canada's inflation target. Real Return Bonds (RRBs) were not considered for this reason and also because the real yields on RRB's are currently very low. In addition, the Dynamic Capital Adequacy Test (DCAT) report does not include a high inflation scenario as a significant risk.

Interest Rate Risk Mitigation Strategy

It is recommended that the Corporation continue to employ duration matching to mitigate its nominal interest rate risk. Cash flow matching and a hybrid of duration and cash flow matching (a "hybrid/bucket approach") were considered but rejected. Duration matching provides the greatest flexibility to the fixed income manager as there are an infinite number of portfolios that can be constructed that will provide a duration that matches the duration of the Basic claims liabilities.

Cash flow matching is costly and difficult to implement, particularly when future liability cash flows far in the future are uncertain. Cash flow matching is more common for short-term liabilities where the timing and amount of the liability cash flows are known with absolute certainty. This is not the case for MPI's claims liabilities.

A hybrid/bucket strategy is more expensive than duration matching, but does reduce convexity risk, which is the risk of non-parallel shifts in the yield curve. However, convexity risk is generally equally likely to result in a gain or loss and therefore over time this risk is expected to even out.

Nonetheless, the Corporation will monitor its assets and liabilities in appropriate time buckets and stress test alternate non-parallel interest rate scenarios to ensure sensitivities to various market movements are understood and within management's risk tolerance.

5) Implementation Plan

Asset Class Vehicles

The majority of the assets will be uniquely matched to specific liabilities, but certain assets (CityPlace and infrastructure) will need to be allocated as they cannot be unitized and assigned to specific liabilities.

Fixed Income

The Department of Finance (DOF) at the Province of Manitoba will manage Government/Provincial bonds supporting all portfolios. Corporate bonds will likely be managed through a segregated mandate so that we can have maximum control over the strategy from a duration, turnover and yield perspective (at least for those backing Basic Claims Liability – those backing non-Basic claims could be in pooled funds).

The Department of Finance is able to deliver the dollar and duration matching strategy that the Corporation requires. There is limited value that an external manager can provide with a universe restricted to Federal and Provincial bonds. In order to limit the amount of change occurring within the portfolio, MPI management recommends that DOF continues to manage the Government bond portfolio.

Private Debt

It is recommended that investment occurs in an open ended pooled fund. See Appendix A for more discussion on this topic.

Equities

It is recommended that investment occurs in pooled funds so that each portfolio has assets that are dedicated to it (no allocations required).

Real Estate:

The Greystone Real Estate Fund (GREF) is a pooled fund so units can be assigned to each portfolio. CityPlace will need to be allocated as it continues to be held in the portfolio. GREF is a highly diversified fund[4] with 325 properties located across the country while CityPlace is a single urban mixed use property. Strictly from an investment diversification perspective it would be preferable to eliminate CityPlace and continue to hold only units in GREF; however MPI is in a unique situation with CityPlace being the owner and largest tenant.

Infrastructure

Infrastructure investments are unitized and therefore units from each asset can be assigned to each portfolio in order to ensure adequate diversification. We will review how the units from each investment assigned can be assigned.

[4] GREF has a gross asset value of $12 billion and exposure to retail, office, industrial and multi-family residential real estate covering a total of 33.8 million square feet.

Manager Searches

Searches must be conducted to select new managers for the following asset classes:

1. Corporate Bonds

2. Private Debt (non-Basic only)

3. Global Equities and Global Low Volatility Equities (non-Basic only)

MPI management recommends hiring a consultant to assist with the search for each asset class at an approximate cost of $20,000 to $35,000 per search (could be less if the same consultant was hired for more than one search). This will ensure that the broadest possible universe of managers is considered during the search. Search consultants also meet with managers on a regular basis and maintain a current database of qualitative and quantitative facts about each manager (ie: returns, risk, drawdowns, growth of AUM, stability of the team and other important metrics).

Implementation Plan for 2018/19 and 2019/20

I. 2018/19

Partially re-allocate assets towards asset allocation targets on a consolidated basis. No major changes to fixed income/growth asset mix of 70%/30% to occur prior to allocation policy change. The allocation policy will be changed on March 1, 2019.

The majority of the transition of assets to reach the 84%/16% mix on a consolidated basis will occur in Q1 2019/20. Therefore, the due diligence, manager search and due diligence work will occur in the latter half of 2018.

Figure 4: Investment Steps for 2018/19

Asset Class	Action	Timing	2019 GRA Consolidated Net Income Impact (Naïve Forecast)
Provincial Bonds	Sell government bonds and purchase Provincial bonds	Q1 2018/19	($8.0M)
Real Estate	Advise Greystone of need to remove money from GREF	Q1 2018/19	
Infrastructure	Begin process to liquidate some infrastructure assets	Q1 2018/19	
Corporate Bonds	Add 1-2 Mandates	Start manager search Q1/Q2 2018/19. Corporate bond allocation no longer managed by DOF by Q4 2018/2019.	($3.1M)
Equities	Complete manager search for Global Equities and Global Low Vol	By Q4 2018/19	$123.7M
MUSH	MUSH bonds mature and proceeds are used to fund other asset classes	Ongoing	
Private Debt	Begin Manager Search Process	Q4 2018/19	
		Total	**$112.6M**

The net income impact on the consolidated portfolio is shown in the last column. Moving to the new provincial and corporate bonds weights is forecasted to have a ($11.1M) impact due to the change to the claims discount rate and its impact on the value of the claims liabilities.[5]

[5] In the ALM scenario, the funds required to purchase private debt are temporarily held in Provincial bonds, which are more liquid than corporate bonds. This increases the Provincial bond allocation relative to the corporate bond allocation, causing a decrease in the claims discount rate and an increase in the value of the claims liabilities, which decreases net income. By Q4 2019/20 in the 2019 GRA forecast private debt is assumed to be fully funded. As a

Equity holdings that are not sold will be transferred from segregated accounts to pooled accounts; this is a practical step given the relatively small allocations (in dollars) to equities in the non-Basic portfolios and it will also cause the associated gains to be realized. The forecasted realization of equity gains is $123.7M (based on the actual gains at Feb. 28, 2018 which will grow by the forecasted return for the asset class during the year). There is no expected impact to net income from reducing exposure to real estate and infrastructure because the accounting classification for these asset classes is "Fair Value Through Profit and Loss". There is no expected impact to MUSH because the accounting classification for MUSH bonds is "Held To Maturity".

II. March 1, 2019

Allocation policy changes to account for segregation of portfolio by line of business.

III. 2019/20

Complete reallocation of investment portfolio to new targets. Overall portfolio composition will move from 70%/30% fixed income/growth assets to 84%/16%. The majority of transition will occur in Q1 2019/20. Private debt will be the last asset class that is funded.

Figure 5 includes the investment income impact, net income impact, and 2019 GRA rating impact for each asset class. The net income impact is provided for Provincials and Corporate bonds, which includes the impact on the claims discount rate. The 2019 GRA rating impact for each asset class is shown for each asset class in the last column.

result, the corporate bond allocation increases relative to Provincial bonds, increasing the claims discount rate, increasing net income by $5.4M as shown in Figure 5.

- In other words, the negative impact of holding additional Provincial bonds at the end of 2018/19 to fund private debt is partially reversed in 2019/20.

Figure 5: Investment Steps for 2019/20

Asset Class	Action	Timing	Consolidated Investment Income Impact/ Net Income Impact	2019 GRA Rating Impact (Naïve)
Provincial Bonds	Increase allocation on a proportionate basis	Q1 2019/20	$6.0M/ $9.9M	0.1%
Corporate Bonds	Increase allocation on a proportionate basis	Q1 2019/20	$1.5M/ $3.0M	
Equities	Liquidate U.S. equities and a portion of CDN equities to fund Global Equities and Global Low Vol	Q1 2019/20	($9.6M)	0.3% (Reflects investment income from assets supporting RSR)
Real Estate	Liquidate a portion of the Greystone Real Estate Fund to reach 4% consolidated target weight	Q1 2019/20	($12.1M)	
Infrastructure	Liquidate a portion of infrastructure to get to 2% consolidated target weight	Q1 2019/20	($4.0M)	
MUSH	MUSH bonds mature and proceeds are used to fund other asset classes	Ongoing	$0M	n/a
Private Debt	Complete search and fund private debt over a period of time	Substantially complete by the end of Q4 2019/20 (based upon available cash from MUSH portfolio)	+$3.8M	n/a
		Total	**($14.4M)/ ($9.0M)**	**+0.4%**

These tables describe the steps outlined in the Gantt Chart in Appendix I.

Accounting Steps

Account for new allocation methodology and investment portfolio. Investigate results to ensure design working as intended.

Corporate Asset Class Actual vs Target Weights

At a high level and from a corporate perspective, the target allocation to fixed income will increase by 14% and will be funded by a reduction in growth assets. The following table shows the actual asset allocations at February 28, 2018, the future corporate target weights for each asset class and the required changes

Figure 6

Actual vs Proposed Target Asset Allocations at February 28, 2018 - Corporate

	Actual		Target		Difference	
	Millions	Percent	Millions	Percent	Millions	Percent
Fixed Income

Recommended Actions

Purchases
The following purchases will need to occur to get to the new consolidated asset allocation:

Corporate Bonds
Real estate, infrastructure and Canadian equities will be required to be partially liquidated to fund the purchase of corporate bonds. As soon as the search for a corporate bond manager is complete funding of the purchases can begin by selling equities (which can be completed in 1-2 weeks). The funding will be completed when the withdrawal from our pooled real estate fund (GREF) is finished; this could take 12 months or longer depending upon available liquidity within the fund.

Provincial Bonds and Private Debt
MUSH maturities will be used to fund the purchase of private debt and Provincial bonds (it will take about two years of maturities[6] to obtain the necessary funds from the MUSH portfolio). See Appendix G for more detailed information about MUSH maturities.

Global and Global Low Volatility Equities
U.S. equities and some Canadian equities will be liquidated to fund the purchase of global equities and global low volatility equities.

Sales
The following sales are recommended to reach the new proposed allocation:

1. Terminate Cardinal (a Canadian equity fund) due to ongoing performance issues
2. Remove money as required from Foyston and QV Investors, keeping intact the large cap/small cap split.
3. Remove approximately $200M from Greystone Real Estate Fund.
4. Remove approximately $30M from infrastructure[7].
5. Sell U.S. equity ETFs.

Transition Manager
MPI management recommends hiring a transition manager to oversee all trading required during the process. Transition managers provide an estimate of the costs related to a transition and the actual costs after the transition is complete. The transition manager works toward minimizing the trading costs and their interests are fully aligned with the client's interests.

Hiring a transition manager is a best practice within the investment management industry and MPI has previously employed a transition manager for major transitions. The cost is expected to be minimal as the implementation manager charges no fees other than a commission on all trades with the charge varying by the liquidity of the relevant market (1 cent/share or less for developed equity markets such as Canada or the U.S.). This is not an increment cost as commissions are payable regardless of who is doing the

[6] Principle and interest payments from MUSH bonds for each of the next three fiscal years are $164.5M, $72.5M and $69.5M. See Appendix G for more details.
[7] Ideally funds will be withdrawn from ICLP; if that is not possible prior to the end of the lock-up period for ICLP (Dec. 31, 2021) then the Sonnet & First Gas co-investments will be sold in order to maximize diversification within the infrastructure portfolio.

trading (ie: the outgoing or incoming portfolio managers). The implementation shortfall reporting is essentially a free benefit of using a transition manager rather than simply asking the outgoing or incoming manager to complete the trades.

The transition manager provides an estimate of the "implementation shortfall", which is comprised of the following costs: commissions, bid-ask spread, market impact, taxes/fees and opportunity cost. In the past multiple transition managers have been invited to provide an estimate of the expected "implementation shortfall" of a desired transition and the manager with the lowest "implementation shortfall" was selected. State Street Global Markets (SSGM) was hired for transitions in 2008 and 2010 and Pavilion was hired in 2013 and 2015.

The table below shows the expected time required for the purchases, sales and manager searches.

Figure 7: Time Required for Purchases, Sales and Manager Searches

Type	Search	Sell	Purchase	Total	When to Start
Fixed Income					
Provincials			1 Week	1 Week	Immediately
Corporates	3 Months		3 Months	6 Months	Start search Immediately
MUSH		2 Years		2 Years	As MUSH matures
Private Debt	3 Months		2 Years	2.25 Years	Q4 2018/19 Start Search
Equities					
Canadian Equities: Cardinal		1 Week		1 Week	Immediately
Canadian Equities: Foyston/QV					When Corporate Bond Manager is Selected
U.S. Equities		1 Day		1 Day	When Global Equity Manager is Selected
Global Equities	3 Months		1 Week	3 Months	2018/19 Q3 Start Search
Global Low Vol	3 Months		1 Week	3 Months	2018/19 Q3 Start Search
Alternatives					
Real Estate		12 Months		12 Months	Immediately
Infrastructure		3 Months		3 Months	Immediately

Inter-Dependencies

Several steps in the implementation plan are dependent upon the completion of other items. The inter-dependent activities are as follows:

1. U.S. equities cannot be sold until the global equity search is complete.
2. Canadian equities cannot be sold until the search for global equity and corporate bond managers are complete.
3. Corporate bonds cannot be fully funded until money is withdrawn from the Greystone Real Estate Fund (GREF).
4. Private debt cannot be fully funded until sufficient interest and principle payments are collected from the MUSH bond portfolio.

The table below shows the dollar values for all growth assets at February 28, 2018 and the recommended target weights for each manager and asset class, as well as the changes.

Figure 8

Reducing Growth Assets - Actual vs Proposed Targets at February 28, 2018

	Actuals ($M) 28-Feb-18	New Target ($M)	change ($M)	current weights	future weights	Percentage of fund sold
Canadian Equity						
Cardinal	$ 80.9	$ -	$ (80.9)	30.5%		**-100%**
Foyston	$ 125.3	$ 72.7	$ (52.6)	47.3%	80.0%	**-42%**
QV	$ 58.9	$ 18.2	$ (40.7)	22.2%	20.0%	**-69%**
Sub-Total	$ 265.1	$ 90.9	$ (174.2)	100.0%	100.0%	**-66%**
Real Estate						
GREF	$ 263.0	$ 64.2	$ (198.8)	86.5%	61.0%	**-76%**

Total	$ 811.0	$ 260.7	$ (550.3)			

Timing of Realizing Gains

It is recommended that unrealized gains on equities should be realized in 2018/19 prior to changes in the allocation policy. There were $115.9 million in unrealized equity gains at February 28, 2018 and the financial model is forecasting the unrealized gains on equities to grow to $123.7 million at the end of 2018/19 based on the expected return of the asset class.

Rationale:

- There is a risk that equity markets could decline, reducing or eliminating the current gains. This risk increases over time.
- It is cleaner and more transparent to realize the gains in 2018/19 prior to the change in the allocation policy and the creation of the new portfolios. This will ensure that the gains will be realized and allocated to the lines of business that are currently holding the equities and therefore earned the gains.

Risks:

- Realizing gains in 2018/19 will significantly increase net income and create a variance to the budgeted net income for 2018/19. The impact of this change must be discussed with the Government of Manitoba.

If this plan is not approved gains can be realized in 2019/20. However, the Basic line of business will have a significantly reduced allocation to equities (7% vs 15%) and therefore the gains attributable to the Basic line of business will be reduced by a similar amount. Retained earnings can be transferred to the Basic line of business as necessary in order to ensure that Basic is made whole and the RSR continues to be adequately funded. The transfer cannot occur until the equity trades are complete.

Equities are the only asset class that is classified as “Available for Sale” and therefore is the only asset class that could impact Net Income as the result of sales.

6) Internal vs. External Management of Corporate Bonds

A paper was provided to the Investment Committee in August 2017 on the decision to use an internal or external manager of Corporate bonds. This paper is summarized below – see Appendix E for the full paper.

MPI management recommends that the corporate bond portfolio be managed externally for the following reasons:

For external:

1. Cost effectiveness
2. Faster and easier to implement
3. Access to a highly skilled and broad team of investment professionals
4. Better pricing and access to new issues due to greater scale
5. Only one local peer (CSSB) manages bonds internally
6. Compensation challenges attracting and retaining a highly skilled portfolio manager
7. There are fixed income managers that specialize in managing assets for insurance companies who understand the unique complexities involved[8]

For internal:

1. Greater control
2. Build a deeper team

Cost

TD Asset Management quoted a fee of 10 basis points, which should be considered as the benchmark for the cost of internal management. On a $500 million portfolio the fee would be $500,000 annually. This is the upper limit for the cost of internal management as a portfolio of less than $500 million would incur a smaller fee.

Staffing

It is expected that at least three additional staff would be needed in order to manage corporate bonds internally: 1) portfolio manager, 2) credit analyst, 3) back-office (for operations/ settlement/ reporting). Total compensation (including all benefits) for these individuals would likely be a minimum of $425,000. This would provide minimal back-up and support to the Portfolio Manager during absences and would involve significant “key man” risk. In addition, it is not clear if the Corporation will be able to compete with private sector employers in order to attract sufficiently talented staff.

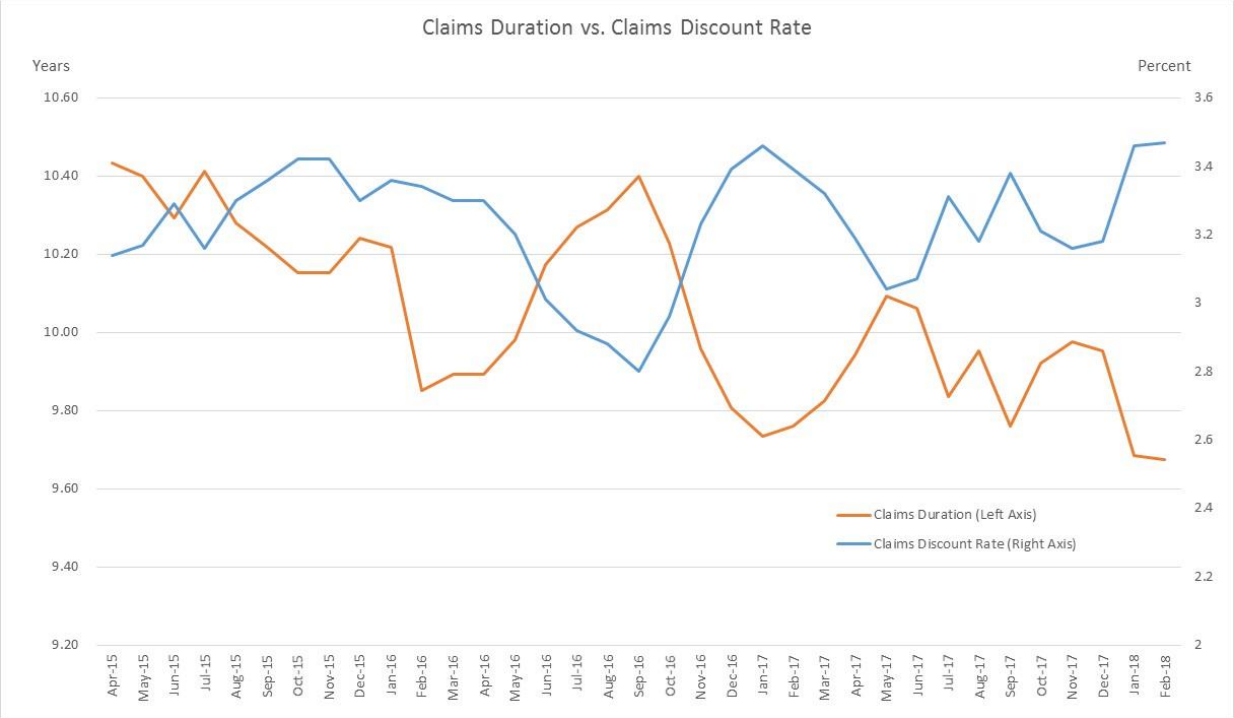
Duration Matching with Two Bond Managers

At the December 8, 2017 Investment Committee meeting, a concern was raised regarding duration matching with two bond managers.

The duration of the claims liability is relatively stable, with changes driven primarily by changes in the discount rate (see the chart below) and annual reviews of the liabilities and subsequent adjustments. The month to month changes are driven by interest rates, which also affect the asset values.

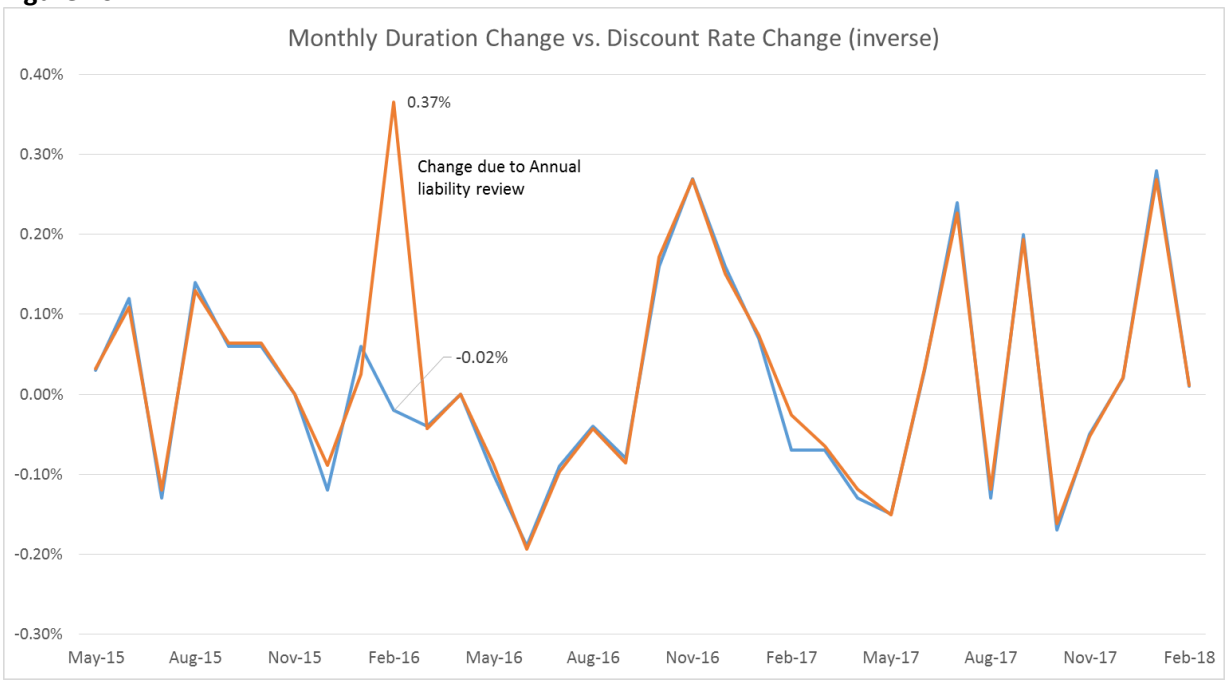
[8] AberdeenStandard ($956 billion AUM), Addenda Capital ($28 billion AUM), Baker Gilmore ($3 billion AUM)

Figure 9



The chart below shows that changes in the duration of the claims liability are directly correlated with changes in the discount rate (which is determined by the yield of the marketable bond portfolio).

Figure 10



Therefore, matching duration with two fixed income managers is not impossible, in fact it is quite feasible. The corporate bond manager would be given a duration target and a range (+/- 0.5 years) and DOF would

adjust the duration of the government bond portfolio in order to maintain the duration of the total fixed income portfolio within 0.25 years of the duration of the claims liability.

7) Accounting Changes

The following outlines the key steps to implement the change in accounting relating to the ALM Transition. There are several outstanding fundamental details that need to be addressed which may impact these estimated time lines. As well, there are some requirements in order to be able to complete (such as securing a test environment to test interfaces and securing PAM resources).

1. Review existing allocation in relation to accommodating subaccounts

   In order to accommodate the need to establish multiple portfolios with different allocations, review and update (if necessary) the existing allocations to ensure that the allocation will still perform as they do currently once new subaccounts are created. (to be completed by April, 2018)

2. Determine new allocation methodology for balance sheet and investment income

   The current balance sheet and investment income allocations are complex and will need to be rebuilt to accommodate the new Asset Liability Matching requirements. This change is anticipated to impact allocation of other accounts within each line of business. (methodology to be solidified by June/July, 2018; building & implementing new allocations to be completed by January/February, 2019)

3. Determine changes required to current portfolios in Princeton Asset Management (PAM)

   In collaboration with the Investment Department and Department of Finance, determine which investments will be part of each of the new portfolios. (to be completed early to mid-June, 2018 – using investments as at the end of May, 2018)

4. Build new portfolios in PAM

   Building new portfolios in the PAM systems is expected to require input from a consultant. Once team has been trained on building individual portfolios, build the portfolios that are necessary. (training to occur in late May, 2018 – once PAM resources are secured; testing of transferring investments, interfaces & minimal allocation testing to occur during June)

5. Create new accounts in Lawson

   New accounts (both balance sheet & income) to be created to accommodate the different ways that the investments are being distributed. These individual accounts will be set up to follow the specific traits of the liabilities they are backing. (to occur in conjunction with creation of new portfolios & transferring of investments (#4 & #7) – beginning mid June)

6. Update detailed mapping of balance sheet account allocations (whether direct or allocated)

   Although this change is in relation to Investments, we need to have a clear understanding of all balance sheet items that are allocated using the same methodology as Investments. Any accounts that are 100% for a specific line of business will need to be allocated to those lines of business prior

to the Investment income allocations. Any balance sheet accounts that are not direct to a specific line of business will be allocated after the Investment Income Allocation using a new allocation. (will begin now and will continue throughout the ALM accounting transition)

7. Move investments to new portfolios

   Move all investment from the existing portfolios to the new segregated & non-segregated portfolios. Ensure that this is done without triggering gains/losses. At this time, it is assumed that this task will be manual, moving each investment individually. (to begin mid June, 2018 and could take 3-6 months depending on level of automation available within PAM)

8. Map assets & income in PAM to Lawson

   As PAM is interfaced to the Lawson system, we need to ensure that all investments in the new portfolios are mapped to the correct new GL accounts in Lawson. This will need to be tested as part of the process to ensure accurate financial reporting corporately and by line of business. (to begin mid June, 2018 and could take 3-6 months depending on level of automation available within PAM)

9. Create allocation check file (similar to what is created for expenses)

   As we do not have detailed allocations records within Lawson (posted at summary level not detailed level), need to create an allocation check file in Excel that will mimic what we are expecting the Lawson allocations to do. This will also allow monitoring of the differences between the current allocations (as defined in Lawson) against the new allocations resulting from the Mercer ALM study. (to begin mid June, 2018 & will continue to be revised as we proceed through the ALM accounting transition; to be complete by January/February, 2019)

10. Update financial asset classifications

    Review accounting classifications and designations for all existing and new asset classes in the context of each portfolio that the financial assets support

11. Test allocations in parallel for a minimum of 6 months (preferably 12 months)

    As transactions may not occur every month, it would be ideal to test the new allocations & provide comparison against the old allocations for a minimum of a six month period and preferably for the full 2019/20 fiscal year. As this time frame is significant, a parallel test is not feasible, so will test retroactively using the allocation check file in #9 above. Testing of allocations should be able to begin in July or August, 2018 (as investments are transferred to new portfolios in #7) and would continue until January/February, 2019.

12. Update accounting policies

    The following policies have been identified that will likely be required to be updated as part of the transition:
    - Policy for Allocation of Balance Sheet Items – Assets, Liabilities, Retaining Earnings and Accumulated Other Comprehensive Income (Loss)
    - Policy for Allocation of Investment Income and Other Comprehensive Income (Loss)
    - Policy for Writing Down Investments

- Policy for Valuation of Private Equity, Venture Capital and Infrastructure Investments.

(to occur by December, 2018 for approval by Board of Directors in January, 2019)

13. Activate new allocation policy – effective March 1, 2019

8) Financial Impacts

The financial model has been updated to reflect the five recommended portfolios and asset allocations. An internal document is available upon request outlining the changes to the financial model.

The results below were produced by the revised financial model.

Impact to Basic Line of Business

Figure 11: Financial Impact to the Basic Line of Business

Basic Net Income ($millions)	**17/18**	**18/19**	**19/20**	**20/21**
GRA Forecast - ALM	34,425	136,292	(5,332)	(4,487)
GRA Forecast - No ALM	34,425	40,348	(3,101)	(490)
Difference	-	95,944	(2,231)	(3,997)
Basic Total Equity ($millions)	**17/18**	**18/19**	**19/20**	**20/21**
GRA Forecast - ALM	211,000	255,869	259,972	265,119
GRA Forecast - No ALM	211,000	257,410	262,363	268,725
Difference	-	(1,541)	(2,391)	(3,607)
Basic MCT Ratio (%)	**17/18**	**18/19**	**19/20**	**20/21**
GRA Forecast - ALM	45%*	71%	62%	59%
GRA Forecast - No ALM	45%	54%	50%	46%
Difference	-	17%	13%	13%

*Represents Modeled Actual

Basic net income is forecasted to increase by approximately $95 million in 2018/19 as significant gains will be realized on equities. Total equity is forecasted to be marginally lower. The MCT ratio will increase by about 15% at the end of 2018/19 because of a lower capital requirements on the Basic line of business investment assets. Interest income is forecasted to increase by approximately $15 million in 2019/20 as there will be more fixed income assets in the portfolio supporting the Basic line of business. These projections are based on a Naïve interest rate forecast.

As per the April 19 presentation to the Board of Directors, the Basic rating impact of these changes is minimal, with a forecasted rate increase of 0.4% using the naïve interest rate forecast, and a rate increase of 0.5% using the 50/50 interest rate forecast.

Value at Risk

The following table shows the 95th percentile Value at Risk for the each of the new portfolios relative to the current portfolio. For each portfolio, the current is defined as the 70% fixed income/30% growth asset class split, except for Basic Claims #2, which is compared to the current fixed income portfolio only. The risk of the consolidated and the Basic claims portfolios are expected to fall substantially. The risk of the portfolio backing RSR is expected to increase modestly.

Figure 15 – Value at Risk

Portfolio	Current	Proposed	Change
Consolidated	-$142 M	-$75 M	+$67 M
Basic claims #1 – vs 70/30	-$122 M	-$38 M	+$84 M
Basic claims #2 – vs. bonds only	-$16 M	-$38 M	-$22 M
RSR	-$8 M	-$9 M	-$1 M

9) Outstanding Items

2019 GRA
If this implementation plan is approved on April 30, 2018 the final rate indication will be provided to the Board of Directors on May 17, 2018.

Investment Policy Statement
An updated Investment Policy Statement will be presented at the July 31, 2018 Investment Committee meeting reflecting the asset allocation approved on April 30, 2018.

Employee Future Benefits (EFB) Funding Policy
This will be presented at a later date to the Audit, Finance & Risk (AFR) Committee.

10) Recommendations

That the Investment Committee members approve the following:

1. All new asset classes including private debt, global equity and global low volatility equities;
2. The creation of five segregated portfolios for Basic Claims Liabilities, Extension, SRE, Employee Future Benefits and RSR;
3. Asset allocations for each portfolio as shown in Figure 2;
4. Implementation plan as described in Section 5;
5. Realization of gains in Canadian and U.S. equity portfolios in 2018/19 (subject to discussion with the shareholder);
6. Hire an external manager for corporate bonds;
7. Hire a consultant to assist with all manager searches;
8. Hire a consultant to manage the transitions between public market asset classes as necessary (purchases and sales).

Appendix A: Private Debt

Mercer recommended a target allocation to investment grade private debt of 15% for Extension, SRE, and RSR and 20% for the EFB portfolio. MPI management supports this recommendation because private debt provides yield enhancement and diversifies the credit risk of the current fixed income portfolio. The asset class is illiquid and Canadian based funds are relatively new while the U.S. market is much more mature and liquid.

I. Overview of Private Debt

Private debt consists of strategies in which a manager sources debt investment opportunities directly from a company (sponsorless) or through a private equity firm that is acquiring the company (sponsored). The focus of this document will be on investment grade private debt.

History

Private debt is not a new business. The traditional core competency of the banking sector has been to borrow money from deposit holders. Since 2008, instead of banks lending this capital to companies, non-traditional lenders are stepping into this role. This opportunity exists because there are businesses that are growing and need financing, while at the same time banks have shrunk their lending balance sheets.

Evolving global banking regulations have restricted the traditional source of capital for borrowers. The unmet need has driven recent growth in the private debt market. Investors view direct lending as an alternative investment or a supplement to fixed income and their interest in the private debt market is partly due to their search for yield.

Market for the Asset Class

The asset class has grown in popularity since the Global Financial Crisis in 2008 as increasing regulations have made lending more difficult for banks. Borrowers often prefer the private credit market as it is more flexible and provides greater privacy than issuing public debt. Issues can be more customized to meet the needs of the borrower with longer terms and other important features.

In the current low interest rate environment institutional investors are searching for positive real yields and diversification opportunities. The result has been the significant growth of the private debt market, which has met the financing needs of mid-market companies as banks have pulled back in order to repair their balance sheets. Non-bank lending now represents 75% of total corporate lending in the U.S[9].

Longer maturities make private debt attractive to investors with long-term liabilities. Terms are usually 7-10 years but can be as long as 30 years.

[9] The Rise of Private Debt as an Asset Class, by Amin Rajan, Create Research/ICG. Sep. 2015, page 11

There is limited information available on private debt, particularly performance, as it is a relatively new private market for institutional investors.

There is ample supply of private debt. Annual issuance of private debt according to Bloomberg Finance was C$8.5 billion in Canada and USD$73 billion in the U.S in 2017. [10]

Types of Private Debt
The following are some of the more common types of investment grade private debt:

1. Infrastructure
2. Real Estate: commercial mortgages, construction financing, etc.
3. Corporate: (sponsored vs. non-sponsored debt)
4. Power and Energy
5. Private Securitization

Demand from Institutional Investors
According to a Preqin survey of investors, 54% of institutional investors have made allocations to private debt and 13% are considering doing so. In addition, the asset class has been adopted by 11 segments of the institutional space including insurance companies and pension funds.

According to a recent survey[11], 45% of the respondents expect to increase significantly the allocation to this asset class.

Three of MPI's local peers are investing in private debt through a combination of Canadian and U.S. based managers.

[10] Estimate from TDAM using Bloomberg Finance data
[11] The Rise of Private Debt as an Asset Class, by Amin Rajan, Create Research/ICG. Sep. 2015

II. Reasons to Invest in Private Debt:

1. Recommended by Mercer

Mercer recommended including investment grade North American debt covering private corporate debt, infrastructure debt, power & energy debt and other forms of private debt. Mercer stated:

- Typically, fully hedges U.S. currency risk and yield curve changes.
- Since private debt is less liquid than public debt, it generally results in an increased yield over a comparable Canadian bond index of about 0.75%.
- An allocation to North American private debt further diversifies credit risk beyond those of Canadian Provinces and Canadian publicly traded bonds.

2. Yield Enhancement

Yields are significantly higher than those offered by similarly rated public debt to compensate for illiquidity

The table below shows the benchmark yields for CIBC, Sun Life and TDAM.

Figure 1: Benchmark Yields of Canadian Based Private Debt Pooled Funds

Firm	Mid	Long
CIBC	n/a	FTSE TMX Canada Long-Term Overall Bond Index
Sun Life	FTSE TMX Canada All Corporate Bond Index + 100 bps	FTSE TMX Canada Long Term Overall Bond Index +75 to 100 bps
TDAM	FTSE TXM Canada Universe Bond Index +125 to 175 bps	FTSE TMX Canada Long Term Overall Bond Index +100 to 125 bps

Private debt offers more protection than listed debt with equity-like returns[12]. Fixed income portfolio returns are largely driven by three factors: duration, credit and private premiums. While duration and credit premiums can be accessed through traditional fixed income securities, such as government and corporate bonds, private premiums are obtained by investing in private debt, generally not traded daily in public markets. Investors in private markets demand a higher premium for similar levels of risk given infrequent trading and complexity of access. This additional yield is the private debt premium over duration and credit.

[12] The Rise of Private Debt as an Asset Class, by Amin Rajan, Create Research/ICG. Sep. 2015

3. Improves Diversification of MPI's Portfolio

Fixed Income
Allocation to investment grade private debt can improve market and geographic diversification relative to MPI's exposure to Canadian public debt. Private debt can provide access to previously inaccessible issuers (those owned by private equity firms, or in the infrastructure or real estate sectors).

Total Portfolio Diversification
Private debt can provide diversification benefits based on low correlations with traditional assets. The asset class provides uncorrelated absolute returns in all market environments.

The recent high volatility in return seeking asset classes and contraction in the issuance of AAA-rated bonds have increased the search for substitutes and private debt can fill that role. The low correlation of private debt with traditional asset classes is one reason to favor an allocation to this asset class.

Private debt tends to be negatively correlated to equities, enhancing the diversification benefits and reducing the volatility of a balanced portfolio.

Private debt offers a compelling source of risk-adjusted returns. Private premiums tend to be less correlated with traditional public markets and integrating them into a traditional fixed income portfolio can enhance the yield premium across a desired duration profile.

III. Risks Related to Investing in Private Debt

1. Interest rate risk

Similar to publicly traded fixed income, the value of private debt is impacted by changes in interest rates. However, this can be partially managed by matching to liabilities with similar durations.

2. Credit risk

Private debt is not rated. As a result, significant reliance on the manager's internal risk rating is required. The strength of the private manager's internal rating mechanisms and team will be an important consideration when selecting a manager.

Private debt generally has similar credit risk to publicly traded corporate bonds because strong covenants, tight legal documentation and asset guarantees allow the lender to monitor the borrower's financial health and limit the issuance of additional debt, reducing the risk of default or bankruptcy. According to the Canadian Institute of Actuaries Asset Default Provision Study[13], it shows that private debt has similar default risk compared to corporate bonds.

[13] Report on the CIA Survey of C-1 Provisions of Life and Health Insurance Organizations in Canada. 2014 Fiscal Year-End. Westbay Research. Exhibit 2.5c for Term-to-Maturity equal to or greater than 10 years. Mean is shown in the table.

Figure 2: 2014 CIA Asset Default Provision Study – Annual Best Estimate (Basis Points)

Rating Category	Provincial Bonds	Municipal Bonds	Corporate Bonds	Private Debt
AA	4	10	13	12
A	6	13	20	18
BBB	16	32	38	40

3. Liquidity

Private debt is a relatively illiquid asset class because each transaction is unique and not publicly traded. However, pooled funds provide some liquidity.

4. Foreign exchange risk

There is a limited private debt market in Canada, while the U.S. market is the most mature and liquid private debt market in the world. As a result, a significant allocation to U.S. private debt must be considered as part of any well diversified strategy. A manager may be required to hedge the foreign exchange risk.

5. Counterparty risk

As with any fixed income portfolio, counterparty risk is managed through effective diversification by issuer, sector, industry, region, rating, vintage, etc.

6. Benchmark tracking risk

There are very few benchmarks for private debt. Therefore, it is impossible to invest passively and difficult to judge the performance of managers.

IV. Manager Selection

The following investment strategy for private debt is recommended:

1. Credit Rating: Investment Grade
2. Structure: Open ended pooled fund
3. Geography: Global mandate that includes exposure to Canada

Investment Vehicle
An open ended pooled fund is the preferred approach compared to a limited partnership. There are many advantages to using a pooled fund structure.

I. Subscription and redemption process is significantly easier compared to short deadlines and extensive legal documentation associated with a closed-end limited partnership.
II. An open ended structure provides vintage diversification, where credit risk, benchmark yields and credit spreads will be diversified across economic cycles.
III. Larger and more diversified pool of assets once initial money is accepted by pool compared to closed-end limited funds.
IV. Less blind pool risk with established funds

Canadian Private Debt Pooled Funds
There are three pooled fund managers in Canada that MPI's Investment Department is aware of – TD Asset Management (TDAM), Sun Life and CIBC. All three funds are relatively new. Note that there are other private debt managers that are U.S. based that the Investment Department has not gathered information from. This is not a complete sample of all available investment grade private debt managers.

- TDAM started their mid and long-term pooled fund in Q2 2016 and has $833M invested and $541M in remaining commitments for a total of $1.4B in commitments.
- Sun Life's mid-term pooled fund was launched in March 2014 and it has a net asset value (NAV) of $1.5B. Sun Life's long-term pooled fund was launched in April 2016, and has a NAV of $500M.
- CIBC is a newer entrant into the private debt space with a long-term pooled fund that received money from its first investor in early 2018.

Manager Search Consultant Recommended
There are many other private debt managers, which should be reviewed during the manager search. A consultant should be hired to conduct a thorough search of available managers in order to identify the best available manager.

Lack of Data
When selecting a manager, investors should be careful about relying on track record data. The success of a private credit manager is based on its capacity to recover capital invested and to generate returns. There is no reliable benchmark data available. Some popular databases produce track records for the private credit universe but it is difficult to understand individual managers'

key levels for risks taken by simply looking at their absolute returns. The most reliable track record of a manager is the track record of their fully realized funds.

A key consideration for manager selection should be whether the manager has maintained a stable strategy over the long term. This demonstrates the ability to continually source transactions.

Fees
For information Sun Life, TDAM and CIBC have sliding fee scales starting at 0.40% - 0.45%.

Figure 3: Canadian Based Private Debt Pooled Fund Fees

Fee Scale	Sun Life	Fee Scale	TDAM	Fee Scale	CIBC
$0	0.45%	First $20M	0.45%	First $50M	0.40%
$50M	0.42%	Next $80M	0.35%	Next $50M	0.35%
$100M	0.37%	Balance over $100M	0.30%	Thereafter	0.30%
$200M	0.33%				

Geographic Exposure
North America is by far the largest market for private debt, accounting for an average of 63% of the market over the last six years[14]. Europe is the next largest market, accounting for approximately 30% of capital raised to invest in private debt.

The Canadian private debt market is too small to achieve adequate diversification with a significant allocation solely to the Canadian market. As mentioned earlier in the document, annual issuance of private debt[15] was C$8.5 billion in Canada and USD$73 billion in the U.S in 2017.

With respect to the three firms that the Investment Department met with:

- Up to 30% of TDAM's fund can be invested outside of North America.
- Non-Canadian dollar assets are limited to less than 30% of CIBC and Sun Life's fund.

Currency Risk
The funds listed above hedge substantially all currency risk. Sun Life's fund is at least 90% hedged, TDAM's fund is at least 95% hedged and CIBC's fund is 100% currency hedged.

V. Recommendation

MPI management recommends using private debt for the non-Basic portfolios. Private debt can provide yield enhancement over comparable benchmarks[16] of 75 bps or higher. Private debt provides additional diversification and has similar credit risk compared to corporate bonds.

[14] 2018 Preqin Global Private Debt Report
[15] Estimate from TDAM using Bloomberg Finance data
[16] See page 3 in the section on yield enhancements for a list of comparable benchmarks.

Appendix B: Global Equities

Mercer recommended that MPI consider a single global equity mandate to replace the U.S. equity mandate in the 2017 Asset-Liability Management Study. Aon Hewitt also recommended an allocation to global equities during the previous ALM study in 2008. The purpose of this paper is to provide background information on whether changing the current U.S. equity allocation to a global equity mandate would be appropriate for MPI's portfolio.

I. What is Global Equity?

In Aon's previous analysis[17], the MSCI EAFE index and MSCI World index were used for the EAFE and Global equity indices respectively. Both indices consist of equities from developed market countries and have no exposure to emerging market countries.

- The MSCI World index includes all of the countries included in the MSCI EAFE index plus the United States and Canada.[18]
- A more comprehensive index of global equities is the MSCI ACWI index that represents the performance of large and mid-cap stocks across 23 developed and 24 emerging markets.[19]

II. Rationale to Exclude Emerging Markets

Historical return, risk and Sharpe ratios for the MSCI ACWI (which includes emerging markets) and MSCI World (excludes emerging markets) indices are shown in Figure 1.

Figure 1: Impact of Emerging Markets

Index	Annualized Returns (%)			Annualized Std Dev (%)		Sharpe Ratio		
	5 yr	10 Yr	Since Dec 31, 1987	5 yr	10 Yr	5 yr	10 Yr	Since Dec 31, 1987
MSCI ACWI	9.8%	6.2%	7.9%	10.4%	16.7%	0.91	0.41	0.36
MSCI World	10.3%	6.5%	7.9%	10.2%	16.3%	0.97	0.43	0.36

Source: MSCI ACWI Index Factsheet March 2018

MSCI World had better returns over 5 and 10 years with lower risk and a higher sharp ratio compared to MSCI ACWI. Since December 31, 1987, the return and Sharpe ratio was the same, with slightly lower risk.

[17] Aon recommended that MPI consider a single global equity mandate to replace the U.S. and EAFE equity mandates in their July 23, 2008 presentation to the ICWG.

[18] The 24 developed markets in the MSCI World index are: Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Hong Kong, Ireland, Israel, Italy, Japan, Netherlands, New Zealand, Norway, Portugal, Singapore, Spain, Sweden, Switzerland, the U.K. and the U.S.

[19] The MSCI ACWI Index includes the MSCI World index (23 developed countries) and 24 emerging markets. The emerging markets are: Brazil, Chile, China, Colombia, Czech Republic, Egypt, Greece, Hungary, India, Indonesia, Korea, Malaysia, Mexico, Pakistan, Peru, Philippines, Poland, Russia, Qatar, South Africa, Taiwan, Thailand, Turkey and the United Arab Emirates.

According to the Pension Investment Association of Canada (PIAC), the average allocation to Global Equities is 19.9% while Canadian equities have an average allocation of 7.2%. U.S. equities has an allocation of 3.3% and emerging markets have an allocation of 3.0%. Based on this information, Canadian pension plans have significant exposure to global equities and minimal exposure to U.S. and emerging market equities.

Based on historical performance and the potential volatility of investing in emerging countries, it is recommended that MPI does not invest in emerging markets. For the purpose of the rest of this paper, it is assumed that Global equity excludes emerging markets. This is different than Mercer's recommendation for Global equity, which included emerging markets.

III. Why a Global Equity Mandate?

Mercer's recommendation in support of a global mandate was based upon both theory and an analysis of historical returns. The Investment Department conducted further research into Mercer's recommendation for a single global equity mandate and our findings are presented in this section.

The case for global equities over U.S. equities:

1. Improves diversification;
2. Gives the equity manager a larger opportunity set;
3. Better reflects market capitalization as it does not structurally overweight U.S. equities, but rather gives the manager the discretion to over or underweight regions based upon changing valuations;
4. Supported by extensive academic research and long standing best practice within the investment management industry;
5. U.S. companies are not without currency risk as they have indirect currency exposure from revenues earned outside their home country.

The world is not split in two types of firms: "local" and "multi-national". Rather, it is a matter of degree with a seemingly intuitive progressive relationship. The more international a firm, the more it is exposed to international factors.

According to Bruno Solnik[20], it is increasingly difficult to justify a "nationalistic" approach to equity investing for the following reasons:

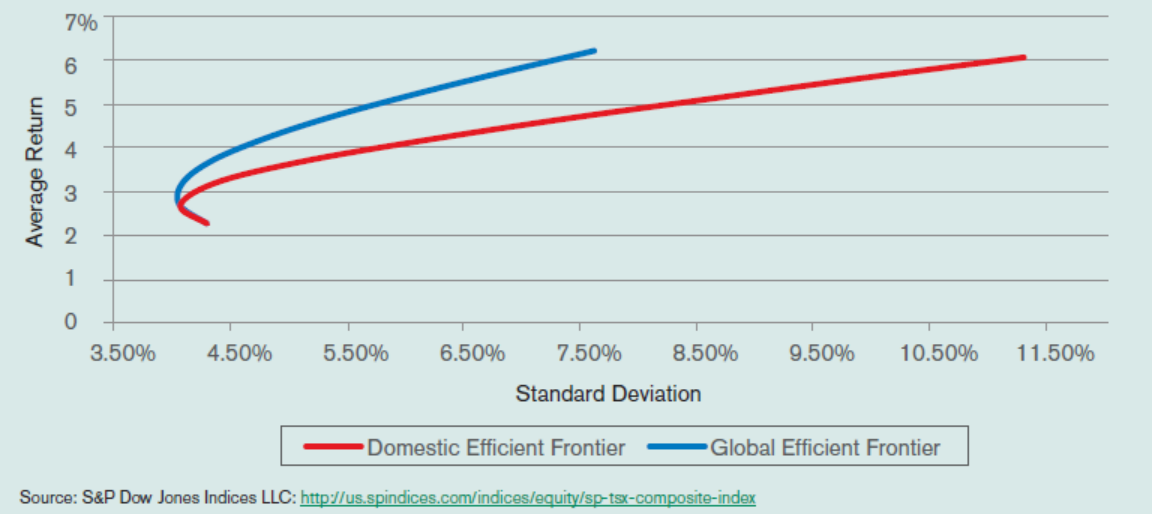
- Global financial markets are integrated;
- Companies pursue global strategies;
- Industries cut across national boundaries;
- Factors that affect stock pricing are global.

[20] The Global Investment Process, Bruno Solnik, February 2002.

One of the important ways for a Global equity manager to add value is to dynamically alter their allocation to the U.S. vs. EAFE nations based upon their view of the various regions. In addition, the manager should view the companies by sector and select the best ones in each sector regardless of where they are located.

More recently, in August 2013, the case for global equities[21] was supported by the fact that global equities expand the efficient frontier beyond the domestic efficient frontier by providing better risk-adjusted returns than the ones available to a domestic-only investor (chart below).

Figure 2: Efficient Frontier for Domestic and Global Equities



IV. Returns, Risk, Risk-Adjusted Returns, and Correlations

The returns, standard deviation and Sharpe ratio for the S&P 500 and the MSCI World index were calculated for the 20 year period ended in March 2018. The table below shows the results of that analysis.

Figure 3: Global vs US Equity Returns

	SPTR Index (USD)	MSCI World (USD)
20 year Returns (Annualized)	6.5%	5.8%
20 year Standard Deviation	14.9%	15.2%
20 year Sharpe Ratio	0.28	0.23

Figure 3 shows the comparison between the MSCI World index and the S&P 500 index (SPTR Index). During the period, the S&P 500 index had a better return, risk and Sharpe ratio returns than the MSCI World index. Therefore, the recommendation to invest in Global equities is not based on historical performance relative to the U.S. equities, but is instead based on theory. By investing in Global equities, it will improve diversification of the existing equity portfolio and reduce correlation to the rest of the portfolio.

[21] The case for Global Equities: Investment Insight, Segal Rogerscasey Canada, August 2013

V. What are others doing?

According to the Pension Investment Association of Canada (PIAC), which represents pension plans with total assets of $1.8 trillion, at December 31, 2016 the average allocation to major equity markets was:

- Global equity: 19.9%
- Canadian equity: 7.2%
- U.S. equity: 3.3%
- Emerging Markets: 3.0%

VI. Currency Risk

Investing in global equities will expose the Corporation to the risks and returns generated from a basket of foreign equities and currencies. This currency exposure can be reduced or eliminated by hedging the portfolio against fluctuating exchange rates. However, doing so that can eliminate the diversification benefits provided by foreign currencies.

Currency hedging of a global equity portfolio does not meaningfully reduce the volatility, given the significant size of the variance of the local return when compared to that of the currency return. While the local return on assets varies substantially depending on market conditions, currency returns exhibit much less volatility. Given that the market volatility associated with investments in equities is relatively large by itself, hedging currency exposures does not necessarily lead to a meaningful reduction in the overall global equity portfolio volatility[22].

Foreign currency exposure moderately increases volatility during some periods and reduces it during others. Depending on the period considered, exchange rates have actually reduced risk. However, over the long term (1990 – 2015), exchange rate volatility does not add significant risk to a global equity portfolio.

VII. Overlap of Canadian equities

Because the MSCI World Index includes Canadian equities there could be some overlap with the holdings of our existing Canadian equity managers. However, the overlap would be minimal as the allocation to Canadian equities within a global manager's portfolio would likely be very small, possibly even zero, given that Canadian equity markets represent approximately 3.6%[23] of the global equity markets. In order to eliminate the possibility of such overlap, the global equity manager could be restricted from having any Canadian exposure, but this would require hiring the manager on a segregated account basis rather than purchasing pooled fund units.

---

[23] *Global Equities: balancing home bias and diversification*, Vanguard Research, July 2014

VIII. Recommendation

It is recommended that a Global equity allocation replaces the current U.S. equity mandate. This recommendation is supported by extensive academic research and long standing best practice within the investment management industry. Key points:

- Based on historical performance and potential volatility related to investing in emerging countries, it is recommended that MPI does not invest in emerging markets.
- The S&P 500 had better historical performance relative to the MSCI World Index. Therefore, the recommendation to replace the U.S. equity mandate with an international equity mandate is not based on historical performance, but instead is based on theory. By investing in international equities, it will improve diversification of the existing equity portfolio and increase the available opportunity set.
- Exchange rate volatility does not add significant risk to a global equity portfolio.
- Both domestic and U.S. equities are not without risk and have indirect currency exposure that is difficult to measure and hedge.
- The recommendation is supported by what other Canadian institutional funds are doing as the average allocation to Global equities is 19.9%.

Appendix C: Global Low Vol

Background
Equities are a significant source of volatility within MPI's investment portfolio. Equity volatility represents a large source of financial and rate-setting risk to the Corporation. The volatility of the Corporation's equity portfolio was identified as one of the key risks in recent DCAT reports.

Mercer recommended an allocation of 2.5% to Global Low Vol on a consolidated basis in the 2017 ALM study. The ICWG is familiar with low volatility strategies, and has considered adding exposure to low volatility strategies in the past. In 2012 the Investment Department brought forward three papers discussing ways to reduce equity risk within the portfolio, with low volatility strategies as the primary strategy that was considered at that time.[24] Exposure to low volatility was recommended in the U.S. equity strategy discussion paper, which was presented to the ICWG on September 16, 2015.

I. What is Low Volatility?

A large number of studies over the last two decades have shown that over the long term low risk stocks deliver higher returns than high-risk stocks. Put simply, invest in stocks with lower price fluctuations over the long term. This anomaly goes against the long-held financial belief that investors in high volatility stocks will receive additional return to compensate for the additional risk.[25]

Low-volatility strategies (also called minimum volatility strategies) are portfolios that are built to capture this market anomaly. Research[26] conducted on the performance of equity markets found that the typical expectation that high-risk stocks will provide superior returns did not materialize over long time horizons. This market anomaly is in sharp contrast with the assumption that most asset allocation models are built upon.

Low volatility strategies are designed to have less volatility than comparable market capitalization weighted strategies. These strategies are based on historical volatility. Volatility and other risk measures are used to determine the weighting of individual stocks in the portfolio. Managers of low volatility strategies invest in equities on a long-only basis and do not use derivatives.

This market anomaly was discussed in a recent study[27] that analyzed the performance of low and high volatility U.S. stocks from 1968 to 2011. The study documented a market anomaly where high volatility stocks (high deciles) provide inferior returns when compared to low volatility stocks (low deciles), as shown in Figure 1.

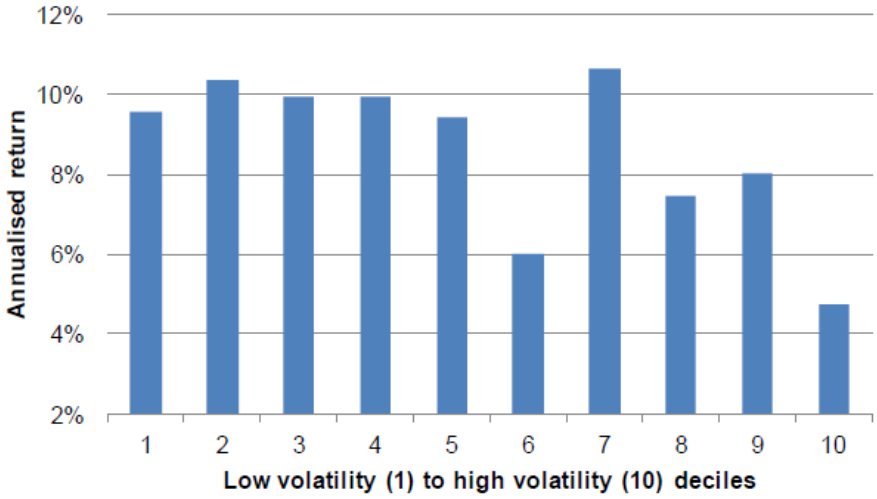
[24] Low Volatility Equity Strategies (ICWG Paper April 2012), Passive Equity Educational Paper (ICWG Paper September 2012), Reducing Equity Volatility (ICWG Paper November 2015)

[25] One explanation for this anomaly is that asset managers purchase high risk stocks because they care about outperforming benchmarks. These managers ignore absolute risk in the hope of outperforming their benchmarks. Managers may also hug the benchmark avoiding low volatility stocks (Baker, Bradley and Wurgler, 2011 and Brennan, Cheng, Li 2012).

[26] Ang, Hodrick, Xing and Zhang research in the U.S. (2006) and internationally (2009), including Canada, demonstrated that riskier stocks underperformed less volatile stocks. Journal of Finance, Vol. 61, No. 1

[27] Cass Consulting, An evaluation of alternative equity indices, March 2013

Figure 1: Performance of Low and High Volatility US Stocks from 1968 to 2011



The objective of low-volatility equity strategies is to outperform the equity market index with less risk than a comparative index portfolio. They seek to provide an asymmetrical risk profile by protecting the portfolio in falling markets, tracking the market index in moderately rising markets while lagging in steeply rising markets. Overall, low volatility strategies seek to simultaneously pursue growth and manage equity risk.

Advantages and Disadvantages of Global Low Vol

Figure 2: Advantages and Disadvantages of Global Low Vol

Low Volatility Strategies	
Advantages	**Disadavantages**
Superior risk-adjusted returns	High tracking error vs. cap weighted indices
Equity downside protection	Underperformance in strong up equity markets
Complementary to traditional equity strategies	

Risk and Return

According to a recent study[28], the comparison of traditional indices (full volatility parent indices) with their low volatility counterparts has shown that low volatility indices had better risk adjusted returns, lower maximum drawdown as well as lower beta than their full volatility parent indices in the U.S. (table below). The better risk-adjusted returns of the low volatility indices relative to their full volatility parent indices was the result of a combination of higher returns and lower annual volatility.

[28] Low volatility equity investing: Structural vs. Statistical, Neuberger and Berman, March 2017

Figure 3: Comparison of US Indices

RETURN & RISK STATISTICS
December 1990 – January 2017

	S&P 500 Index	S&P 500 Low Volatility Index	MSCI USA Index	MSCI USA Minimum Volatility Index
Annual Total Return	10.0%	11.0%	10.1%	10.4%
Annual Volatility	14.2%	10.9%	14.3%	11.2%
Risk-Adjusted	0.70	1.00	0.71	0.93
Beta to Index	1.00	0.58	1.00	0.72
Median 30-Day Return	1.3%	1.2%	1.3%	1.2%
Up-Market Capture	100%	72%	100%	79%
Down-Market Capture	100%	48%	100%	64%
Max Drawdown	-51%	-35%	-51%	-41%

Source: Bloomberg LP.

A recent study[29] assessed the impact of currency hedging when investing in low volatility equity strategies. The study showed that for a Canadian based investor, a 100% currency hedged portfolio invested in the MSCI World Minimum Volatility Index does not improve the Sharpe ratio relative to an unhedged investment in the MSCI World Minimum Volatility Index for a 10 year period ended in June 2015.

The returns, risk-adjusted returns and risk metrics for the MSCI World equity index and the MSCI World Min Vol index were calculated for the 20 year period ended in March 2018. In addition, a blended index based on 65% MSCI World index and 35% MSCI Minimum Volatility index was also determined. The table below shows the results. This blended rate is based on the proposed consolidated target allocations of 4.6% in Global Equities and 2.5% in Global Equity Low Vol.

Figure 4: Benefit of Blended exposure in Global Equities and Global Low Vol

	MSCI World (*)	MSCI Min Vol (*)	65% MSCI World + 35% MSCI Min Vol
20 year Returns (Annualized)	5.8%	4.4%	5.3%
20 year Standard Deviation	15.2%	10.8%	13.4%
20 year Sharpe Ratio	0.23	0.19	0.23

(*) Returns in USD

According to the table above, the blended 65% World, 35% Minimum Volatility had lower returns, lower volatility and the same Sharpe ratio than the standard global equity benchmark index (MSCI World). The low volatility index (MSCI Min Vol) had 29% less volatility than the standard global equity benchmark (MSCI World). This observation aligns with Mercer's Phase 2 report that indicates that a low volatility index will have a return volatility of about 25% less than the standard global equity index.

The table above also indicates that the composite index (65% MSCI World index/35% MSCI Min Vol index) provides diversification benefits as it has the same risk-adjusted returns and lower volatility than the standard global equity index (MSCI World) offsetting some of the MSCI World index volatility.

[29] Minimum Volatility Strategies & Currency Impact, State Street Global Advisors, 2015

Recommendation

Global Low volatility strategies are a good complement to traditional market capitalization weighted equity strategies. This strategy is expected to provide superior risk-adjusted returns, equity downside protection with relatively high tracking error when compared to traditional market capitalization weighted benchmarks. Based upon prior research completed, Mercer's recommendation, and academic research, a low volatility equity strategy is recommended by MPI management to reduce the volatility of the equity portfolio.

Appendix D: Corporate Bonds

June 1, 2017 Board Submission:

"The Corporation has been contemplating the conservative risk profile of its investment portfolio allocated to fixed income securities and specifically the long-term benefits of increasing its allocation to corporate bonds since 2015. AON Hewitt provided their opinion on the level of corporate bonds in MPI's portfolio in Phase 2 of the Asset Liability Management (ALM) study published in December 2014. AON recommended adding a specific allocation to corporate bonds to the asset allocation located in the Investment Policy Statement. AON Hewitt wrote a second report in May 2016 on MPI's exposure to Municipalities, Universities, Schools and Hospitals (MUSH) and Corporate bonds in their Fixed Income Analysis report. AON's recommendations to be neither over nor underweight in this security class were unchanged from their 2014 ALM report."

- SGI and ICBC have 17% and 26% of their total portfolios in corporate bonds, respectively. In that context, the proposed target of 18% is reasonable.
- The average P&C insurance company has a 41% allocation to corporate bonds as a percentage of the total portfolio.
- This 27% total bond portfolio weight in corporate bonds is similar to the FTSE/TMX Long Term Bond Index weight of 23%.

July 27, 2017 Board Submission:

"The rationale to increase the allocation to corporate bonds was presented to the Board on June 1, 2017. In summary, Aon Hewitt was asked to review this issue in the 2015 ALM study and a follow up report in May 2016. Aon's recommendation was that a tactical allocation to corporate bonds can add value.

MPI is currently underweight in corporate bonds relative to the FTSE/TMX Canada Universe Bond index and also relative to SGI & ICBC. An increased allocation to corporate bonds will better diversify the fixed income portfolio and increase the overall yield of the fixed income portfolio."

Appendix E: Internal vs. External Management of Corporate Bonds

Corporate Bonds: External vs. Internal Management

August 8, 2017

External Management

External Management Fees

TD Asset Management quoted a fee of 10 basis points. This is the benchmark for the cost of internal management. On a $500 million portfolio the fee would be $500,000. This is the upper limit for the cost of internal management as a portfolio of less than $500 million would incur a smaller fee. A 5% allocation to corporate bonds would represent $135 million, and a fee of $185,000 (higher than 10 bps due to TDAM's sliding scale).

Local Peers

Of the five largest local pension plans/asset managers in Winnipeg (TRAF, CSSB, HEB, WCB, City of Winnipeg), only one, CSSB, manages fixed income internally. HEB considered managing fixed income internally but was unable to find a qualified manager at a reasonable cost and abandoned the idea. The City of Winnipeg's fixed income portfolio was managed internally until about 2010, but is now managed externally (the current CIO is a former bond manager and therefore has direct knowledge of the pros & cons of managing fixed income assets internally).

Other benefits of external management: the time required to become fully invested is much less than for internal management.

Internal Management

Additional Staff Required

The Investment Department currently has 3.6 FTEs. These staff currently do the following: forecasting investment income (interest rates, equities and other asset classes); monitoring & oversight of external investment managers (performance, risk & compliance); monthly reporting on manager/fund performance and compliance with the terms of the IPS; return calculations; impairment analysis; preparing presentations for the IC; research into various topics as directed by the IC/ICWG/management.; working with external consultants on manager searches, Asset-Liability Management studies, etc.; preparing investment section of the GRA and responding to all investment related questions from the regulator.

It is expected that at least three additional staff would be needed in order to manage corporate bonds internally: 1) portfolio manager, 2) credit analyst, 3) back-office (for operations/ settlement/ reporting). Total compensation (including all benefits) for these individuals would likely be a minimum of $425,000. This would provide minimal back-up and support to the Portfolio Manager during absences and would involve significant "key man" risk. However, it is not clear if the Corporation will be able to compete with private sector employers in order to attract sufficiently talented staff, as was discovered by HEB.

Economies of Scale

The cost to set up the proper facilities to support an internal bond management team is high. Economies of scale are limited with a mandate of $500 million (or less) with respect to bond pricing, access to expertise, and software.

1) **Bond Pricing**: The bond market is an over-the-counter market where prices are largely quoted verbally. As a result the market is very opaque with varying bid-ask spreads. Larger clients generally enjoy preferential pricing and access to new issues. A $500 million account is relatively small in the institutional bond market and therefore MPI's internal bond management team would be unlikely to receive tight bid-ask spreads from bond dealers. This cost is hard to measure and it is indirect (ie: it is not an explicit fee which is clearly communicated to the client).

2) **Expertise Required:** This proposal assumes that MPI would hire two investment professionals to manage its corporate bond portfolio. External fixed income asset managers employ teams of investment professionals, including: economists, strategists, quantitative analysts (Phds), credit analysts, equity analysts, etc. It is highly unlikely that MPI could replicate the depth or breadth of such a team internally. For 10 basis points we can gain access to the entire team, analytics and reporting that an external manager offers.

3) **Software:**
   - An order management system would be necessary to record & report trades. Bloomberg's AIM order management system has an annual fee of USD$205,000, but we could likely start with Bloomberg's Vcon & PORT systems, which are free but require additional manual data entry and reconciliation, etc.
   - Investment accounting system: upgrades to PAM may be necessary. Cost is TBD.
   - Benchmarking: if we decided to use a market based benchmark such as the FTSE/TMX Universe Index licensing fees would be applicable in order to obtain the complete list of all constituents and their weights on a daily basis. Cost is TBD.

Governance

When funds are managed internally there is an inherent conflict of interest between the portfolio manager and the compliance officer responsible for oversight and performance evaluation. If the strategy does not meet performance expectations responsibility must lie with the architects of the strategy (IC/ICWG/investment department, etc) and those responsible for implementation and execution (the portfolio manager). It is much more difficult to replace an internal employee than to replace an external investment management firm.

Performance

Can an internal team at least match the performance of the benchmark? Can they effectively compete with external managers and place in the top two quartiles of investment managers? If not then any fees saved are irrelevant.

Control

Internal management of fixed income would provide full control of the strategy, which would be beneficial from an Asset-Liability Management perspective.

Time

It will take a significant amount of time to get the necessary systems, data, reporting and people in place.

Recommended portfolio: Pension.1

Each table above shows the portfolios that were identified on the efficient frontier for the relevant liability, from which the recommended portfolio was selected.

Basic portfolio #3 was selected because it had the highest yield but did not include private debt. Private debt was not included in the Basic Claims portfolio in order to limit risk within the portfolio and because including private debt could complicate the duration matching strategy. A significant allocation to MUSH bonds within the bond portfolio supporting the Basic claims liability was made in order to maximize the yield of the portfolio.

The 50/50 portfolios were selected for Extension, SRE and RSR because they provide a reasonable balance of income and growth asset classes.

The 60/40 portfolio was selected for the Employee Future Benefits portfolio because it provides additional exposure to growth assets and is similar to the portfolio that the CSSB employs in managing the employees portion of the pension.

Rejected Asset Classes:

The following asset classes were rejected from consideration:

1. Real Return Bonds
2. Diversified Growth Funds
3. Leveraged bond funds (RRBs & Provincial bonds)
4. Private equity

These above asset classes were rejected because they were either deemed too risky or the expected returns were too low.

The following asset classes were considered in the study but did not make the efficient frontier:

5. Global bonds
6. High yield bonds
7. Emerging market debt
8. Commercial mortgages

Appendix G – MUSH Principal Balance and Interest

MUSH Bond Portfolio

Fiscal Qtrs	Principal balance before payment	Principal	Interest
2018-Q1	$ 708,665,431	$ 105,017,646	$ 4,874,799
2018-Q2	$ 603,647,785	$ 8,901,144	$ 5,422,521
2018-Q3	$ 594,746,641	$ 15,947,696	$ 8,902,105
2018-Q4	$ 578,798,946	$ 9,558,944	$ 5,912,298
2019-Q1	$ 569,240,002	$ 12,356,043	$ 7,655,624
2019-Q2	$ 556,883,959	$ 8,830,327	$ 4,949,770
2019-Q3	$ 548,053,632	$ 15,542,524	$ 8,065,908
2019-Q4	$ 532,511,108	$ 9,706,439	$ 5,384,396
2020-Q1	$ 522,804,670	$ 12,565,730	$ 7,041,866
2020-Q2	$ 510,238,939	$ 8,990,843	$ 4,484,546
2020-Q3	$ 501,248,096	$ 15,094,152	$ 7,259,416
2020-Q4	$ 486,153,944	$ 9,175,358	$ 4,882,736
2021-Q1	$ 476,978,585	$ 12,741,661	$ 6,420,506
2021-Q2	$ 464,236,925	$ 8,713,077	$ 4,012,835
2021-Q3	$ 455,523,848	$ 14,717,704	$ 6,494,458
2021-Q4	$ 440,806,144	$ 9,550,448	$ 4,427,997
2022-Q1	$ 431,255,695	$ 12,477,531	$ 5,797,330
2022-Q2	$ 418,778,164	$ 8,507,846	$ 3,567,327
2022-Q3	$ 410,270,318	$ 14,220,021	$ 5,766,998
2022-Q4	$ 396,050,297	$ 9,840,888	$ 3,955,850
2023-Q1	$ 386,209,409	$ 11,941,065	$ 5,202,002

Appendix H – Custodial Fee Schedule

RBC Investor Services Custodial Charges
For the Province of Manitoba/MPI
Effective December 1, 2005

Transaction Charges
Transaction fees are calculated and collected monthly.
A transaction is defined as a security received, delivered, substituted or matured, free or against payment, book based or physical for one CUSIP.

	STP* Transaction	Non STP Transaction
Canadian Transactions	CAD 8.00 per transaction (Book-based & Physical)	CAD 15.00 per transaction (Book-based & Physical)
US Transactions	CAD 20.00 per transaction (Book-based)	CAD 25.00 per transaction (Book-based)
Euroclear Transactions	CAD 45.00 per transaction (Book-based)	CAD 55.00 per transaction (Book-based)
Cancellation	CAD 5.00 per transaction	CAD 5.00 per transaction

Safekeeping Fees
Calculated on the daily average market value of equities and par value of debt instruments (including money market) and collected monthly on the following basis:

Portfolio Holdings	0.25 basis point

Where market values are not available, a charge of CAD $10.00 per CUSIP per month will apply.

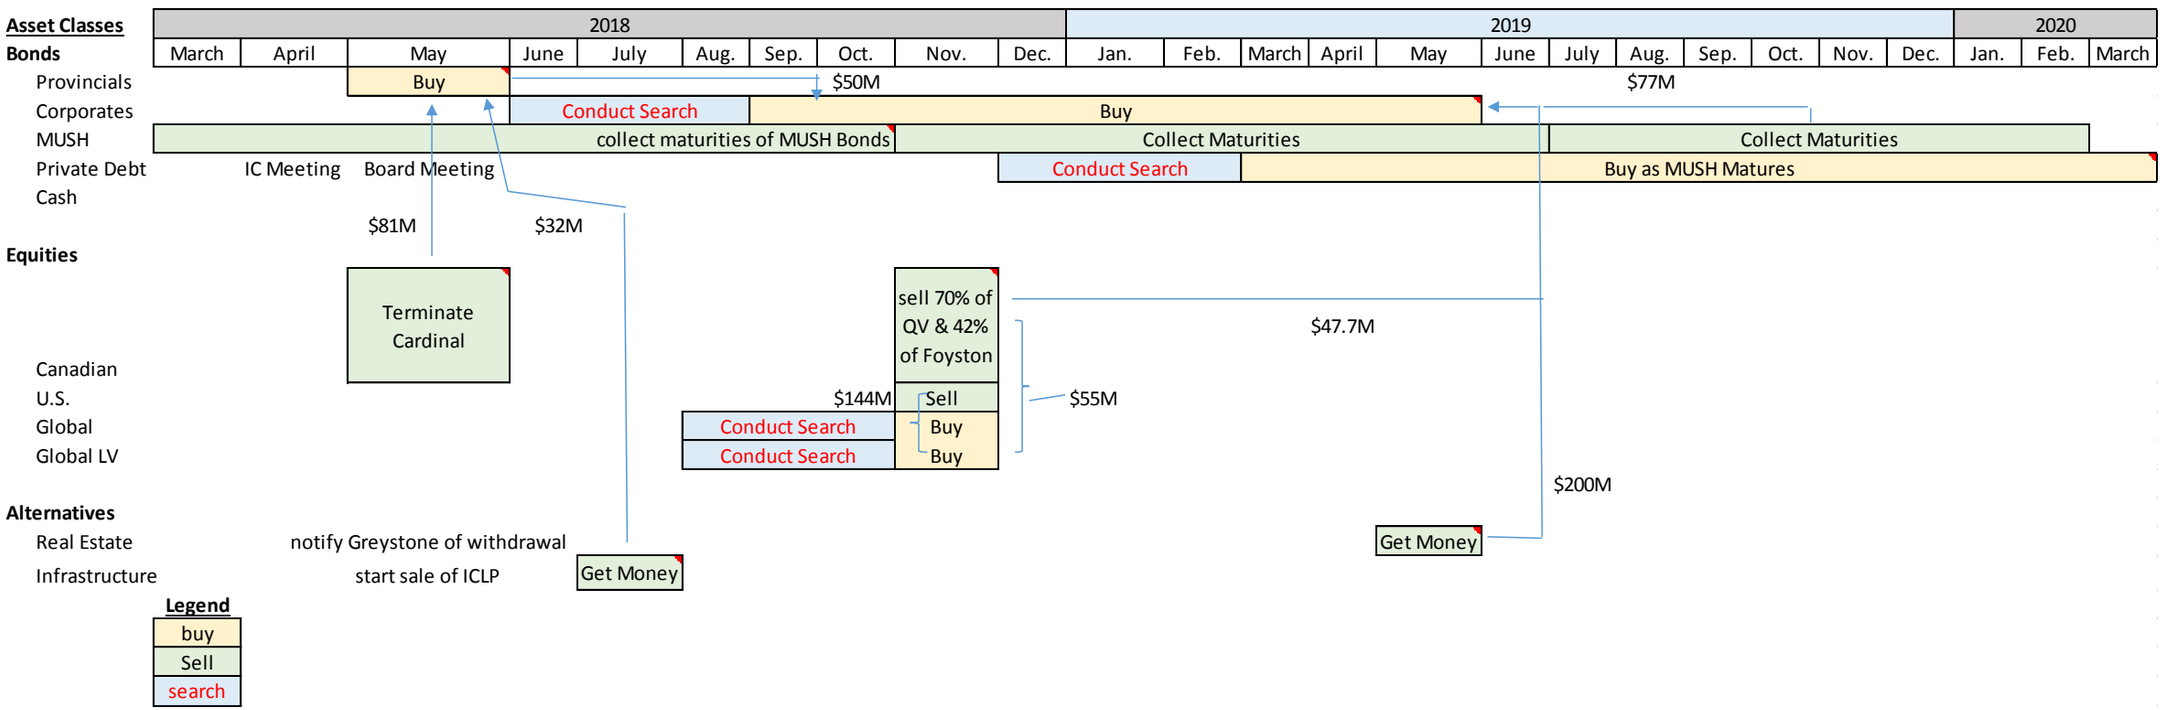
*Straight through processing

Appendix I – Gantt Chart

The chart below sets out the various steps in the implementation plan and the approximate timing of each.

The following steps are inter-dependent:

1. U.S. equities cannot be sold until the global equity search is complete.
2. Canadian equities cannot be sold until the searches for a global equity manager and a corporate bond manager are complete.
3. Corporate bonds cannot be fully funded until money is withdrawn from the Greystone Real Estate Fund (GREF).
4. Private debt cannot be fully funded until sufficient interest and principle payments are collected from the MUSH bond portfolio.



Appendix 17: ALM TECHNICAL CONFERENCE RESPONSES

Following the ALM Technical Conference, the Public Utilities Board prepared a list of 32 requests for additional information. These requests, and MPI's responses (in italics) are provided below.

MPI Technical Conference ALM March 14, 2018

List of Requests

1. MPI to provide additional detail where possible on the discussions that took place between MPI and Mercer to get a sense of the different alternatives. [T22-23]

Mercer provided efficient frontiers that identified optimal portfolios by starting with our current asset classes only and added new asset classes incrementally. Various points were identified on the efficient frontier, including the current portfolio, portfolios with the same risk as the current portfolio, and same return as the current portfolio. Various risk stats were provided for each portfolio, including: expected 10 year return, anticipated surplus, volatility, information ratio, duration and hedge ratio, as well as the asset allocation. This occurred in late October 2017. [See Attachment A: Basic Efficient Frontiers – Forward Curve, pg. 13]

It was determined that the risk tolerance of MPI's Board of Directors for the assets backing the Basic claims liabilities was very low and that mitigating risk was more important that maximizing returns. The focus was on further reducing interest rate risk, with a willingness to take on modest credit risk (as long as it is diversified and cost effective).

Based on this risk tolerance, it was determined that the best way to mitigate the interest rate risk associated with the Basic claims liability was to develop an investment portfolio with 100% fixed income assets (i.e. no growth assets) and dollar and duration matching those assets to the claims liabilities.

Several portfolio options were presented, including the minimum risk portfolio (MRP), a portfolio with mostly Provincial bonds, a portfolio adding corporate bonds and a portfolio adding private debt. See Attachment B: ALM Phase 2 Summary Report, pg. 20. Ultimately, management recommended the portfolio with Provincial, corporate & MUSH bonds.

2. MPI to provide additional detail on "initial" findings made by Mercer, as well as "final" findings made by Mercer, including [T18, 134, 135]:

a) MPI to provide the independent set of capital market assumptions (correlation matrix, expected returns to the nearest basis point, volatility, initial interest rate forecast) – set of capital market assumptions for all asset classes that were considered. [T130]

Attachment C contains a detailed explanation of the methodology that Mercer uses to develop its capital market assumptions. This material is commercially sensitive and is the subject of a motion for confidential treatment. This document includes projected returns based upon Mercer's standard interest rate forecast (see Appendix B to Mercer's Phase Two Report for returns based upon the forward curve). See Attachment D for a complete correlation matrix including inflation and minimum risk portfolios.

i. Also, if possible, how these would have changed from the start of the project to the final ones that were actually used in optimization. [T23]

The only change was to the interest rate forecast, which is explained in the response to question #4.

b) Min/Max Asset Allocation constraints and other constraints: A brief rationale for each minimum and each maximum constraint would minimize questions in future information requests. (e.g., 0% minimum for all asset classes to prohibit "shorting" or selling securities that are not owned) [T93]

There were no caps on Canadian equity or other foreign equity.

MUSH bonds had a minimum weight of 10% because there is no active secondary market for them. Therefore, liquidating these

bonds is not an option (reductions are achieved through maturities). As a group MUSH bonds, private debt and commercial mortgages had a maximum weight of 25% of the total portfolio due to the illiquid nature of these asset classes. Real estate, infrastructure, private equity and growth fixed income was not allowed to exceed the allocation to equities in order to limit the allocation to illiquid asset classes.

See *Attachment A: Basic Efficient Frontiers – Forward Curve, pg. 8*

c) Liability Benchmark Portfolio composition: Minimum Risk Portfolios are requested for all lines of business where optimizations were performed (e.g., Basic, Pensions, etc.), and all sets of assumptions (e.g., MRP including RRBs, and excluding RRBs) [T131]

The Minimum Risk Portfolios are shown in the figure below:

Figure 1: Minimum Risk Portfolios

Line No.	Asset Classes	Basic (Nominal)	Basic (Real)	Pension (Nominal)	Pension (Real)
1	**Treasury Bills**		26.0%	-17.0%	-11.0%
2	**Short-Term Provincial Bonds**	28.0%	8.0%		
3	**Mid-Term Provincial Bonds**	18.0%			
4	**Long-Term Provincial Bonds**	54.0%			30.0%
5	**Long-Term Corporate Bonds**			117.0%	
6	**Real Return Bonds**		66.0%		81.0%

d) Asset Allocations (e.g. along Efficient Frontiers, Alternatives) [T70, 88, 89, 90, 104]

See the response to question 1.

3. MPI to provide what the inflation volatility assumption assumed in the model is. [T25-27]

The inflation volatility assumption was 2.6%.

4. MPI to provide Mercer's standard forecast vs. the implied forward rates used. [T28]

Mercer's interest rate forecasts are shown below.

Figure 2: Mercer Interest Rate Forecast – Standard

Line No.	Year	Federal T-Bills	Short Term	Mid Term	Long Term	Overall RRB
1	**0**	0.76%	1.42%	1.87%	2.25%	0.60%
2	**1**	1.80%	1.58%	2.04%	2.34%	0.65%
3	**2**	1.08%	1.59%	2.11%	2.36%	0.66%
4	**3**	1.24%	1.79%	2.24%	2.40%	0.68%
5	**4**	1.41%	1.96%	2.42%	2.59%	0.79%
6	**5**	1.58%	2.13%	2.60%	2.78%	0.90%
7	**6**	1.75%	2.30%	2.78%	2.97%	1.01%
8	**7**	1.91%	2.47%	2.96%	3.16%	1.11%
9	**8**	2.08%	2.64%	3.14%	3.35%	1.22%
10	**9**	2.25%	2.81%	3.32%	3.54%	1.33%
11	**10**	2.41%	2.98%	3.50%	3.73%	1.44%

Figure 3: Mercer Interest Rate Forecast – Forward Curve

Line No.	Year	Federal T-Bills	Short Term	Mid Term	Long Term	Overall RRB
1	**0**	0.76%	1.42%	1.87%	2.25%	0.60%
2	**1**	0.99%	1.56%	1.96%	2.29%	0.60%
3	**2**	1.18%	1.67%	2.04%	2.32%	0.59%
4	**3**	1.34%	1.77%	2.11%	2.35%	0.59%
5	**4**	1.47%	1.86%	2.17%	2.38%	0.59%
6	**5**	1.56%	1.93%	2.23%	2.41%	0.58%
7	**6**	1.63%	1.99%	2.28%	2.43%	0.58%
8	**7**	1.68%	2.03%	2.32%	2.46%	0.58%
9	**8**	1.72%	2.07%	2.36%	2.48%	0.58%
10	**9**	1.75%	2.11%	2.40%	2.50%	0.57%
11	**10**	1.77%	2.13%	2.43%	2.52%	0.57%

5. MPI to review materials that were provided to them in order to determine the portfolio that came out of the initial interest rate forecast (potentially provide this at a later date). [T28]

The portfolios based upon Mercer's standard interest rate forecast had 66% to 78% bond allocations with durations of 4.4 to 7.1 years; these portfolios had relatively low hedge ratios (43% to 69%). See Attachment E: Basic Efficient Frontiers – Std Curve, pg. 13

The portfolios based upon the forward curve all had durations of 10.3 years and 100% hedge ratios. See Attachment A: Basic Efficient Frontiers – Forward Curve, pg. 13.

6. MPI to provide the calculations to show how the 3 items roll up to get to the 89/11 percent point fixed income allocation (the dollar amounts and show how the total is arrived at). [T33-34]

The financial model estimated a total growth allocation of 7.6% for the Basic line of business, which excludes the pension portfolio. This was calculated by multiplying the total value of the Basic Claims portfolio and the RSR portfolio by their respective asset allocations, summing and calculating the combined weights for each asset class. Our financial model projects balances of $1,851 million in the Basic Claims portfolio and $330 million in RSR portfolio at February 28, 2019. The asset allocation for Basic Claims portfolio is 100% fixed income. For RSR the asset allocation is 50% fixed income, 35% equities and 15 % alternative assets. The math is as follows: (50% x $330) / (1,851 + 330) = 7.6%*

**Pension assets are not included in the Basic line of business for financial reporting purposes.*

7. MPI to review the Mercer material and determine what can be shared in regards to the pensions and the particular trade-offs leading to the 40/60 and elaborate on what considerations lead to that.

a) MPI to confirm if the kind of review of the universe of pension plans and their allocations is something MPI has readily available. [T34]

A formal review of the asset allocations of the complete universe of Canadian pension plans was not completed. Instead Mercer provided general advice that Canadian pension plans employ a wide range of asset allocations. There is no universally correct asset allocation. This decision is based upon a number of factors, including whether the plan is open or closed, the funded status of the plan, the ratio of retirees to working members, the stability of the plan sponsor, and other factors.

Harry Markowitz, the pioneer of Modern Portfolio Theory, conducted research into asset allocation and recommended a 60/40 split between growth assets and fixed income assets, which was taken into consideration. This was the most common asset allocation for pension plans for many years. Also taken into consideration was the asset allocation of the Civil Service Superannuation Board (CSSB),

which is approximately 70/30. The CSSB manages the employees' portion of the pension assets and is a viable option to manage the employer's portion of the pension assets.

8. MPI to provide at a future date terms and description of the methodology by which Mercer estimated the initial interest rate forecast and the implied forecast rate. [T51]

See the response to Question 1a.

9. MPI to provide more information and detail on minimum and practical constrained with examples of each that were used in the modelling (in the future in the GRA or IRs). [T100]

Practical and reasonable modelling approaches and constraints are necessary. Mercer recommendations on modelling were as follows:

I. U.S./EAFE/Emerging Markets Equity should be bundled into a single MSCI All Country World Index (ACWI) equity mandate

Rationale: A single ACWI mandate provides greater mandate efficiency and affordability; expands equities to include Emerging Markets Equity; allows the manager to select best in class stocks without artificial geographic boundaries.

II. Global Bonds/High Yield Bonds/Emerging Market Debt (one-third each), bundled together and referred to as Growth Fixed Income.

Rationale: Diversified package of liquid bonds which diversifies return and risk sources; allows the manager to tactically re-align the exposures to capitalize on market trends.

III. MUSH Bonds/Private Debt/Commercial Mortgages (referred to as Illiquid Debt) limited to 25% of the total portfolio.

Rationale: Need to diversify sources of return; avoid over-reliance on illiquid credit risk.

IV. Real Estate/Infrastructure/Private Equity as a group not exceed the allocation to public equities.

Rationale: Need to diversify sources of return; avoid over-reliance on illiquid assets; allow some flexibility in implementation).

Other constraints:

i. MUSH Bonds minimum allocation of 10% of total portfolio to recognize the illiquid nature of this asset class and to plan for an orderly wind down of the position.

ii. Private Equity maximum allocation of 10% of total portfolio to control risk.

10. MPI to contact Mercer to determine if their RFP response is confidential and if MPI is able to release it (RFP describes model in some detail). [T105]

Mercer's response to the Corporation's RFP is commercially sensitive and is the subject of a motion for confidential treatment.

11. MPI to review the working papers received from Mercer that provided the various efficient frontiers and determine what they are able to release that might be helpful in the understanding of the process. [T105]

See Attachment B: "ALM Phase2 Summary Report" pages 52 – 57 for efficient frontiers.

12. MPI to review documents and determine what would be helpful to provide (i.e. any other Mercer reports, presentations by Mercer to MPI working group / Board / Investment Committee, Aon report – if similar detail could be provided as Aon did – significant modelling appendices with Aon, Mercer would have had to have done similar work as in the Aon appendices for Mercer to provide their recommendations). [T22, 106, 109, 110]

See Attachments A & B.

13. MPI to provide a list of what documents have been chosen not to be provided with explanation or basis for each not being provided.[T107]

The document from the Kick-Off meeting has not been provided as this was used by Mercer to gather information. This document formed the basis of the Phase One Report. Final versions of all other documents have been provided.

14. MPI to provide an index of what documents could not be provided with Mercer's concerns, if any, for each as support for the document not being provided. [T107, 109]

Mercer raised no concerns about providing any documents, other than their Capital Markets Assumptions and their response to our RFP, both of which will be provided on a confidential basis.

15. MPI to provide a detailed table of forecast assumptions for the major asset classes relative to Mercer. [T114-115]

Figure 4: MPI 2019 GRA Return Assumption 2019/20 to 2022/23 versus Mercer 10 Year Return Assumption

Line No.	Asset Class	MPI 2019 GRA Assumption	Mercer 10 Year Return	Difference
1	***1. Cash****	1.2%	1.4%	-0.2%
2	**2A. Provincial (50% Short, 50% Mid-Term)***	2.3%	2.6%	-0.3%
3	**2B. Provincial (Long-Term)***	2.9%	3.0%	-0.1%
4	**2C. Corporate (Mid-Term)***	3.0%	3.5%	-0.5%
5	**2D. Corporate (Long-Term)***	3.9%	3.8%	0.1%
6	**3. MUSH****	4.4%	3.0%	1.4%
7	**4. Private Debt - Long*****	5.3%	3.5%	1.8%
8	**5. Canadian Equity**	7.0%	6.7%	0.3%
9	**6. Global Equity**	7.0%	6.7%	0.3%
10	**7. Global Low Volatility**	6.4%	6.1%	0.3%
11	**8. Real Estate**	6.0%	5.4%	0.6%
12	**9. Infrastructure**	7.0%	6.2%	0.8%
13				
14	* MPI assumption for cash and marketable bonds is with a naïve forecast, Mercer's assumption uses forward rates (see Appendix B - ALM Phase 2 Report)			
15	** MPI assumption for MUSH is based on book yield, Mercer uses the market value.			
16	*** MPI assumption for private debt will need to be revisited for next year's rate application as more information is gathered on the new asset class			

16. MPI to confirm and provide after the hearing if a floor was used in the modelling of interest rate risk decline risks in the Mercer analysis. [T115]

No floor was used in the modelling of interest rates in the Mercer analysis.

17. MPI to review working papers and models that Mercer provided and determine what can be made available (specifically in regards to risk stats - calculating the median surplus, probability of surplus, and probability of a positive real return all over 5 years – and if MPI would be reporting on these broader results). [T122-123]

See Attachments A & B.

18. MPI to contact Mercer to confirm if any additional information can be provided in regards to Appendix B (i.e. nothing shown currently about how forecast of expected values might be changed through the forecast period, how to measure volatility around those forecasted levels, etc.) [T128]

See Attachment B: "ALM Phase 2 Summary Report", pgs. 22 & 23.

19. MPI to obtain and provide interest rate forecasts, both for standard and implied forward rates. [T129]

See the response to Question 4.

20. MPI to confirm understanding of total returns (and provide detailed information in the future if statement is not correct) [T129-130]:

a) "these are the returns for the outlook period and that, you know, the standard deviation tells you about the volatility of those returns and in their forecasting, they would use those two (2) pieces of information to -- to develop a normal curve for each. So, I'll conf -- I'll reach out to them to confirm that understanding and if it's incorrect we'll provide that information in the future."

Mercer forecasts total returns.

21. MPI to provide from the correlation matrix, the correlation of inflation and the model with respect to each asset class. (i.e. appendix has asset class correlations, but does not have a line item or column in the matrix for inflation) [T130-131]

See the response to Question 2a.

22. MPI to review materials to see if information/details can be provided, specifically in regards to better understanding of the ALM process, identification and selection of options based on investment committee and Board's risk appetite, etc. [T135-136]

Private debt was excluded from the Basic Claims portfolio as it was deemed to be incompatible with the Investment Committee's low appetite for risk for the Basic Claims portfolio. Similarly, leveraged bond funds and diversified growth funds (DGF) were excluded from consideration from all portfolios.

23. MPI to provide more information on how return expectations were derived and in more decimal points (i.e. in terms of expected return assumptions for Canadian, US, and global equity, it would be helpful to know if the assumptions were identical – 6.7 vs. 6.71 can result in differences for modelling purposes). [T188]

See the response to Question 2a for how return expectations were derived, and Appendix C for the Capital Market Assumptions. Mercer does not forecast returns beyond one decimal point.

24. MPI to confirm if there were any caps on the Canadian equity, or the other foreign equity that were binding. [T93]

See the response to Question 2b.

25. MPI to review working papers and see if information can be made available in regards to the results for the value at risk for the 90, 95, and 97.5 percentiles. [T97]

This information is included in Appendix B: "ALM Phase2 Summary Report" on page 21.

26. MPI to provide some of the other metrics and insight into what role the metrics played as compared to the deliberative process (CAC requested and stated this might be something to explore at a later date). [T97]

The following metrics were provide by Mercer:

- *Expected Return*
- *Excess return over liability benchmark*
- *1 year Surplus volatility*
- *Excess return/surplus volatility*
- *1 year median surplus*
- *1 year 90th percentile VaR*
- *1 year 95th percentile VaR*
- *1 year 97.5th percentile VaR*
- *Interest rate risk hedge ratio*
- *Median surplus in 5 years*
- *Probability of surplus in 5 years*
- *Probability of 5 year positive real return*
- *Non-MUSH yield*

The metrics informed the selection of the preferred portfolio as they quantified the risk and reward of each portfolio that was identified on the efficient frontier. The metrics also facilitated comparison with the current portfolio.

See: "Appendix B: ALM Phase2 Summary Report", pg. 21 for the specific metrics for the various portfolios considered for the Basic Claims portfolio.

27. MPI to reach out to Mercer to ask about the possibility of revising the table to show each of the liability benchmark or the minimum risk portfolio for Basic and pension, nominal and real, included in the correlation matrix with the other asset classes. [T132]

See the response to Question 2a.

28. MPI to provide a more detailed allocation for each portfolio. [T137]

MPI sought further detail and clarification from the PUB on May 17th, 2018, and received the following reply on May 29th.

"if MPI can provide the results of the modelling by asset classes of what was tested, including alternative portfolio compositions, that should be sufficient"

Based on that clarification, MPI believes this request has been answered in response to question 1 and question 5.

29. MPI to confirm the statement made during the conference [T40-41]:

a) "And I believe -- I'll have to check, but I believe it's 10 percent for the RSR, and 15 percent for pension. So it rolls up to -- again, I –I have to check, but it's -- it's zero for the Basic claims' liability, and 10 to 15 percent for the other portfolios."

Private debt has the following allocations:

- *15% for Extension, SRE & RSR*
- *20% for Employee Future Benefits (Pension)*

30. MPI to confirm if any constraints were given to Mercer in the modelling, or if it was left open for the model to determine what was optimal. [T171-172]

See response to Question 2b.

31. MPI to report at the GRA in regards to looking at showing Basic consolidated, taking into account Basic liabilities, the RSR, and the allocation to pensions. [T70-71]

This information will be included in the General Rate Application in Part VI Investments.

32. MPI to provide a discussion regarding the implications of the ALM study on the Dynamic Capital Adequacy Testing (DCAT) Report. [T57, 64, 208, 209]

The Corporation's base forecast (before rate changes or capital maintenance fees) in the 2019 General Rate Application and the Dynamic Capital Adequacy Testing report includes the assumed implementation of the new Asset and Liability Management (ALM) program.

As discussed in Rate Stabilization Reserve (RSR) section of the 2019 GRA, the implementation of the ALM program reduces the required capital under both the DCAT analysis and the Minimum Capital Test. In the 2017 DCAT (2018 GRA), the Corporation indicated that it required a lower RSR target of $201 million or 37% MCT and an upper RSR target of $438 million or 100% MCT. Using the same methodology as the 2018 GRA, in the 2018 DCAT (2019 GRA) the Corporation determined that it requires a lower RSR target of $143 million or 34% MCT and an upper target of $370 million or 103% MCT.

However, the Corporation has agreed with the PUB (Order 130/17) that it is reasonable to calculate the range of the RSR based on a 2 year scenario, 1-in-40 scenario rather than a 3 year, 1-in-40 scenario. As a result, the Corporation determined that it requires an upper RSR target of $305 million or 85% MCT. For more information, see the RSR section of the 2019 GRA.

ASSET LIABILITY STUDY

PRELIMINARY EFFICIENT FRONTIER ANALYSIS FOR BASIC INSURANCE COMPONENT

ASSUMPTIONS BASED ON FORWARD YIELD CURVE

Manitoba Public Insurance

NOVEMBER 8, 2017

Angelo DiNoto
Pawel Piesowicz
Dave Makarchuk

TODAY'S MEETING AGENDA

- Summary of discussions to date:
  - Proposed asset classes
  - Proposed constraints
- Review results of the efficient frontier analysis
- Key goals:
  - Generate discussion on the direction of potential asset mix changes
  - Confirm range of asset mixes to include in the analysis
  - Possibly identify 4 to 5 strategic target asset mixes for further analysis
- Discussion and next steps
- Appendix
  - Capital Market Assumptions

SUMMARY OF DISCUSSIONS TO DATE
ASSET CLASSES

© MERCER 2017

ASSET CLASSES CONSIDERED
BASIC, EXTENSION, SRE, RSR, PENSION

	Return Seeking	Inflation Sensitive	Interest Rate Sensitive
Broad Markets	**Canadian Equity** US Equity **EAFE Equity**	Real Return Bonds 3x Real Return Bonds	Cash MUSH Bonds Provincial Bonds Federal Bonds Canadian Corporate Bonds 3X Long Provincial Bonds
Other Markets	Emerging Markets Equity Global Low Volatility Equity		Global Bonds High Yield Bonds Emerging Market Debt
Alternative Investments	Private Equity Diversified Growth Fund	Infrastructure – Direct Global Real Estate - Direct Cdn	Private Debt – Universe Private Debt – Long Commercial Mortgages Long Comm. Mortgages

Asset Class descriptions along with pros/cons are in the Appendix.

Asset classes already included in the target asset mix

Additional asset classes included in the analysis as suggested by Mercer (approved by MPI Investment Committee)

© MERCER 2017

ASSET CLASSES TO CONSIDER CONSTRAINTS

- Practical and reasonable modelling approaches and constraints are necessary. Mercer recommendations on modelling are as follows:

  ü U.S./EAFE/Emerging Markets Equity should be bundled into a single ACWI[1] equity mandate
  - Single ACWI mandate provides greater mandate efficiency, affordability
  - Expands equities to include Emerging Markets Equity (note: Samsung is an example)
  - Allows the manager to select best in class stocks without artificial geographic boundaries (i.e., attaching a multinational company to a single country)

  ü Global Bonds/High Yield Bonds/Emerging Market Debt (one-third each), hereafter referred to as Growth Fixed Income
  - Diversified package of liquid bonds which diversifies return and risk sources of the Growth Portfolio

ACWI is All Country World Index. MSCI ACWI is currently about 52% US, 32% EAFE, 12% Emerging Markets Equity

PRELIMINARY ANALYSIS
EFFICIENT FRONTIERS
BASIC INSURANCE – NOMINAL LIABILITY BENCHMARK

© MERCER 2017

EFFICIENT FRONTIERS
OVERVIEW

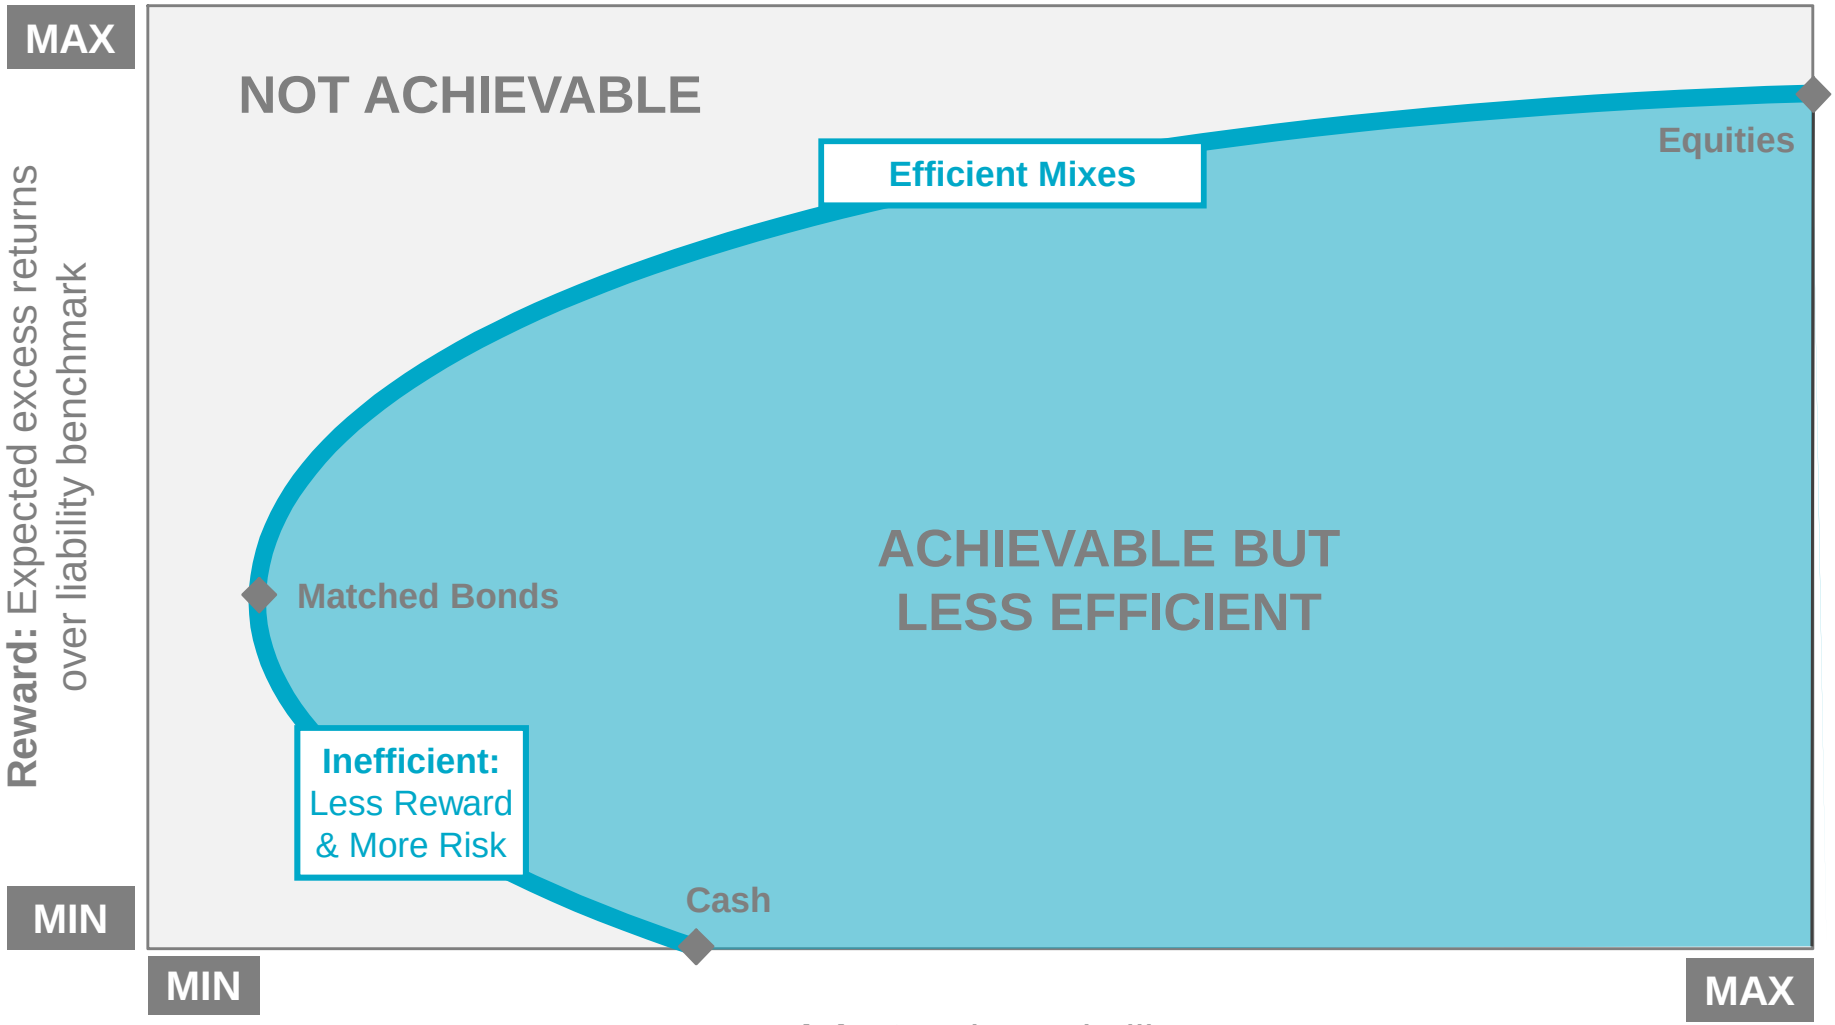
- Characteristics of the efficient frontier tool:
  - One year time horizon
  - Incorporates liabilities through use of a “liability benchmark”
  - Uses optimization techniques to determine asset mixes with optimal risk/return characteristics
  - Flexible tool that can be used to quickly consider many asset mixes
  - Outputs include expected returns and surplus volatility
- Useful for identifying portfolios that:
  - Minimize surplus volatility for a specified level of expected growth; or
  - Maximize expected growth for a specified level of surplus volatility

Note:

- Surplus volatility (i.e., standard deviation) is a measure of the expected volatility of financial position and is expressed on an annualized basis as a percentage of assets
- Surplus volatility of 10% means that there is, roughly, a 1 in 6 chance that the financial position will be:
  - Worse than expected by more than 10% of the starting asset value
  - Better than expected by more than 10% of the starting asset value

© MERCER 2017

EFFICIENT FRONTIERS
ASSET-LIABILITY EFFICIENT FRONTIER



INTEREST RATE RISK
LIABILITY BENCHMARK

- In order to evaluate financial risks and to find portfolios that will minimize them, we develop a fixed income portfolio that reproduces the fluctuations of the liabilities (called the Liability Benchmark)
- Based on information provided by Manitoba Public Insurance, the duration and the liability benchmark portfolios for Basic Insurance liabilities (unpaid claims) are summarized below:

	Nominal[1]	Real[2]
Duration	10.3 years	10.3 years
Liability Benchmark		
• Treasury Bills	--	26%
• Short Provincial Bonds	28%	8%
• Mid Provincial Bonds	18%	--
• Long Provincial Bonds	54%	--
• Real Return Bonds	--	66%

Note: These figures are preliminary and may be refined as part of the study.

[1] Nominal considers fixed future inflation at 2% p.a.
[2] Real reflects sensitivity to future inflation rates

© MERCER 2017

INTEREST RATE RISK
DURATION AND HEDGE RATIO

- Interest rate and inflation risk arise from the fact that a change in market interest rates and/or inflation rates may change liabilities differently than assets
  - A commonly used measure of interest rate sensitivity, “duration”, measures the percentage change in assets and liabilities for each 1% change in market interest rates
  - As an example, a liability “duration” of 10 years means that for each 1% rise (fall) in interest rates, the liabilities are expected to decrease (increase) by approximately 10%
- The interest rate hedge ratio, which measures how much of interest rate risk is hedged, depends on three factors:
  - Ratio of assets to liabilities
  - Percentage of assets allocated to the liability matching portfolio
  - Duration of the matching portfolio relative to that of the liabilities

How much interest rate risk is currently hedged for the Basic Insurance component (assuming assets are equal to liabilities)?

70%
assets allocated to matching portfolio

✖

RISK MANAGEMENT
INVESTMENT LEVERS

Lever 1

- Allocation between growth and hedging assets
- Perhaps most important decision, which is often determined by ability and willingness to accept risk

		Target Mix
Hedging	Marketable Bonds	50%
	Non-Marketable Bonds	20%
	Predominately Manitoba Schools and Non-Manitoba Provincial bonds	
	Approximately 2% each to Federal bonds and Corporate bonds	
	Subtotal	**70%**
Growth	Canadian Equity	10%
	US Equity	5%
	EAFE Equity	0%
	Canadian Real Estate	10%
	Infrastructure	5%
	Private Equity	0%
	Subtotal	**30%**
Total		**100%**

Lever 2 (Hedging portfolio structure)

- Structure of the fixed income portfolio affects interest rate risk (not all bonds are created equal)
- e.g., real return bonds can offset inflation risk

Lever 3 (Growth portfolio structure)

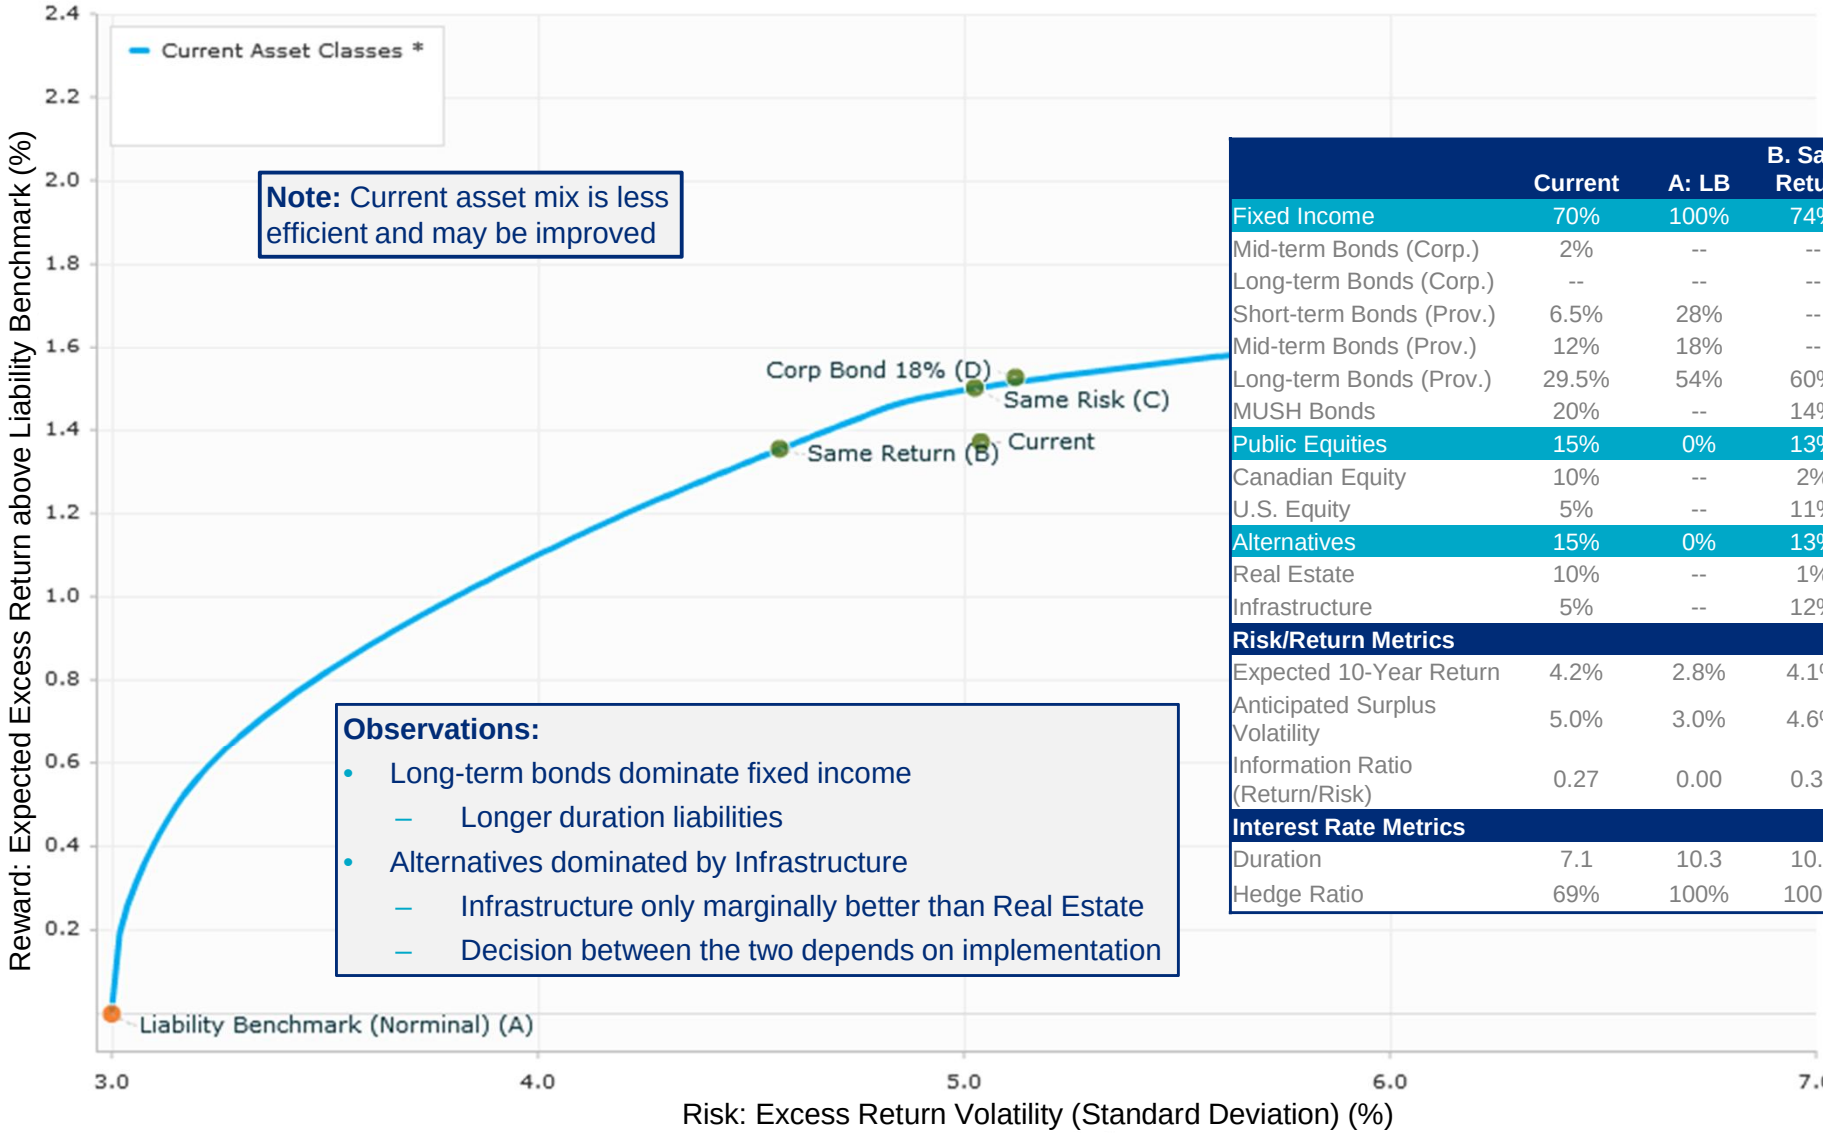
- Diversifying the growth portfolio can improve its risks / reward characteristics

Other Levers

- Currency hedging, leverage, alpha transport, tactical asset allocation, etc.

© MERCER 2017

EFFICIENT FRONTIERS (MINIMALLY CONSTRAINED)
CURRENT ASSET CLASSES ONLY



Observations:

- Long-term bonds dominate fixed income
  - Longer duration liabilities
- Alternatives dominated by Infrastructure
  - Infrastructure only marginally better than Real Estate
  - Decision between the two depends on implementation

	Current	A: LB	B. Same Return	C. Same Risk	C. Same Risk
Fixed Income	70%	100%	74%	74%	74%

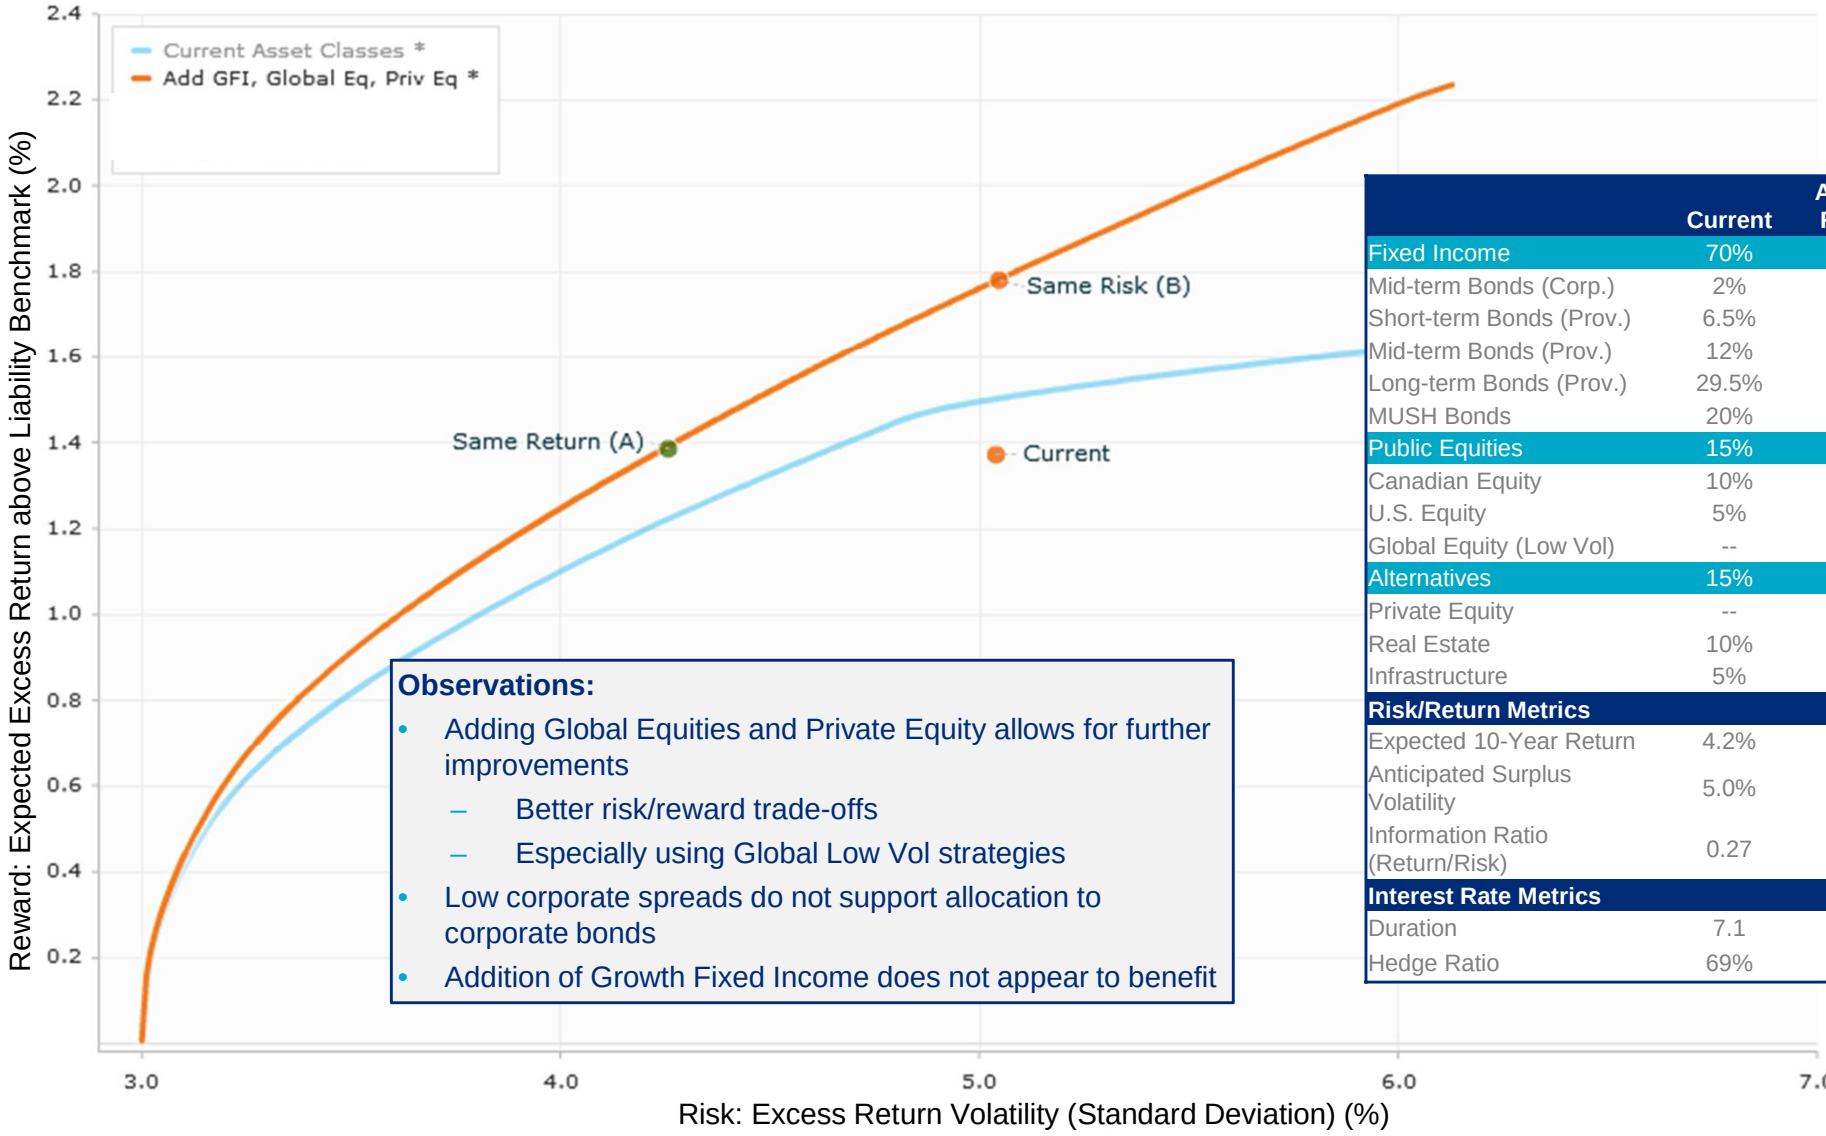
EFFICIENT FRONTIERS (MINIMALLY CONSTRAINED)
ADDING GROWTH FIXED INCOME, GLOBAL EQUITIES & PRIVATE EOUITY



Observations:

- Adding Global Equities and Private Equity allows for further improvements
  - Better risk/reward trade-offs
  - Especially using Global Low Vol strategies
- Low corporate spreads do not support allocation to corporate bonds
- Addition of Growth Fixed Income does not appear to benefit

	Current	A:Same Return	B. Same Risk
Fixed Income	70%	81%	76%
Mid-term Bonds (Corp.)	2%	--	--
Short-term Bonds (Prov.)	6.5%	--	--

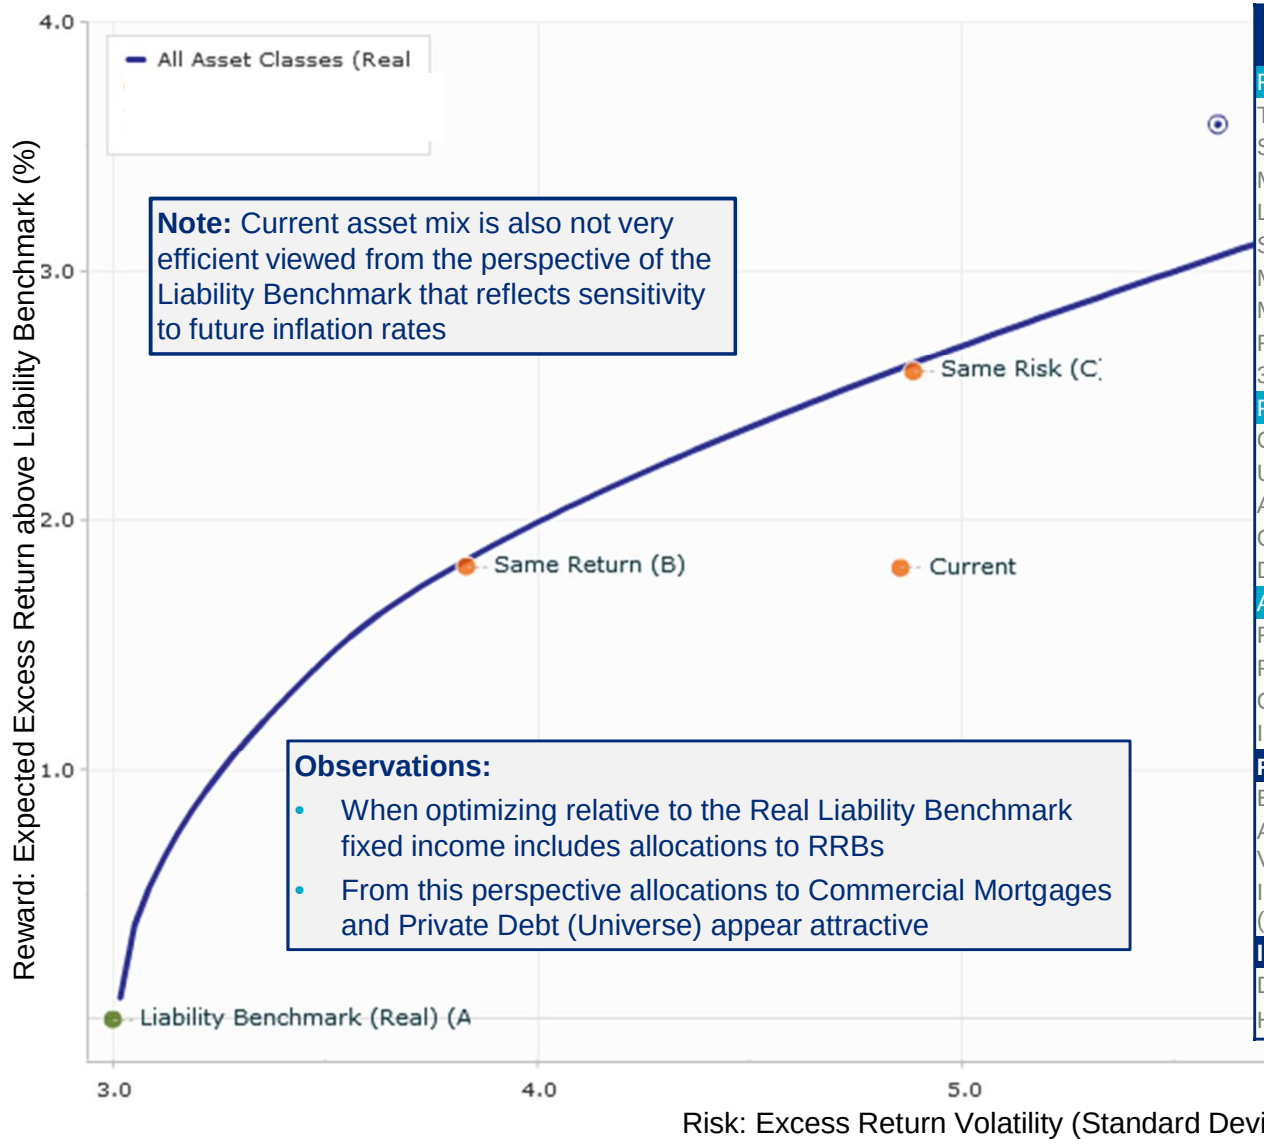
PRELIMINARY ANALYSIS
EFFICIENT FRONTIERS
BASIC INSURANCE – REAL LIABILITY BENCHMARK

© MERCER 2017

EFFICIENT FRONTIERS (MINIMALLY CONSTRAINED)
REAL LIABILITY BENCHMARK



Note: Current asset mix is also not very efficient viewed from the perspective of the Liability Benchmark that reflects sensitivity to future inflation rates

Observations:

- When optimizing relative to the Real Liability Benchmark fixed income includes allocations to RRBs
- From this perspective allocations to Commercial Mortgages and Private Debt (Universe) appear attractive

	Current	A. Real LB	B:Same Return	C. Same Risk
Fixed Income	70%	100%	59%	43%
Treasury Bills	--	26%	--	--

Hedge Ratio	69%	100%	100%	99%

© MERCER 2017

ADDITIONAL COMMENTS
REAL RETURN BONDS

- Currently, RRBs offer relatively attractive inflation protection.
- This is best understood by calculating the total expected yield of an RRB and then comparing it to a conventional bond with the same quality and maturity. Below we consider 30-year Government of Canada Bonds:

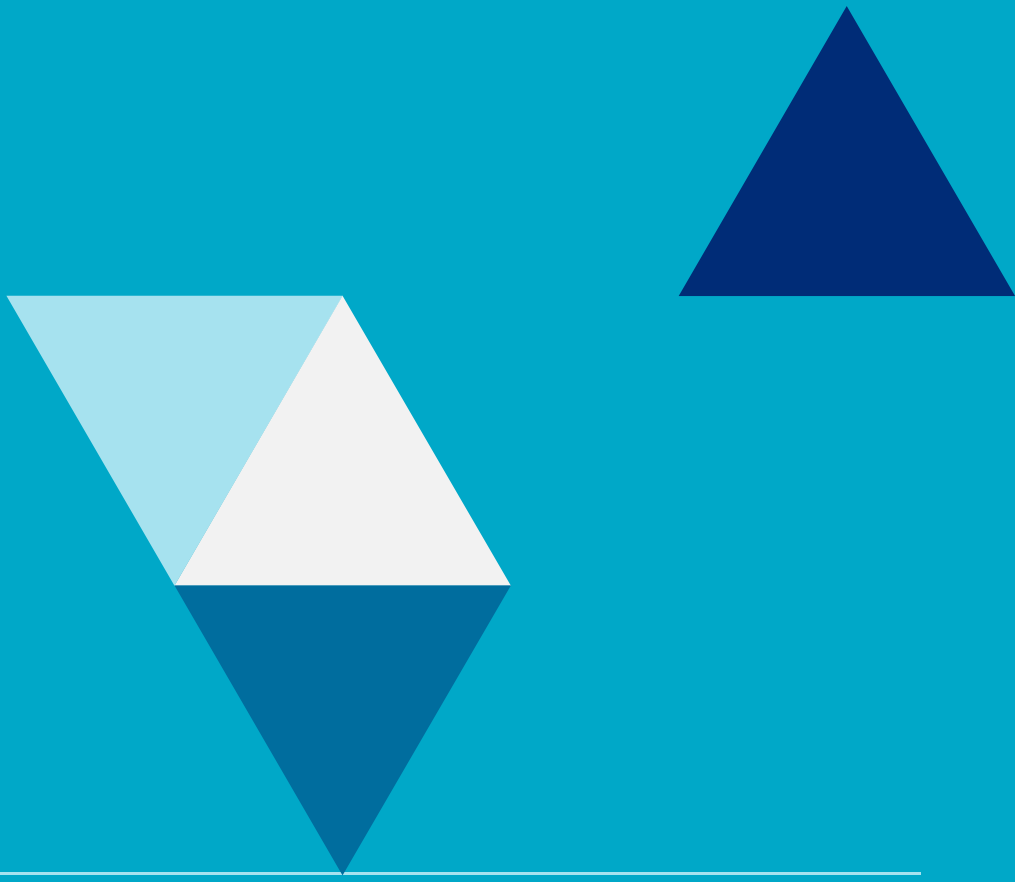
RRB Real Yield	**0.6%**
30-year BEIR[1]	**1.6%**
Total Yield	**2.2%**
30-year conventional bond yield	**2.3%**

- The Canadian RRB market is fairly large and liquid. There are currently 15 outstanding issuances, among which eight were issued by the Government of Canada and 7 are provincial issuances.
- RRBs issued by the Government of Canada are the most liquid and currently have a total market value of about $72 Billion.
- Finally, it is worth noticing that despite RRBs offering attractive inflation protections, the expected return on RRBs is below its long-term historical levels with a current real yield of 0.60%.

[1] BEIR is the Break Even Inflation Rate which is calculated as the difference between a conventional bond and an RRB. The BEIR can be interpreted as the capital markets expectation on future inflation.

© MERCER 2017

NEXT STEPS



© MERCER 2017

NEXT STEPS
KEY DECISIONS

- Risk or reward: where feasible, is the preference to:
  - Reduce risk (keeping expected return at current level)?
  - Increase expected return (keeping risk at current level)?
  - Something in between?
  - Increase risk and expected return?

- Degree of comfort with:
  - With changes to current portfolios
  - Interest rate hedging

© MERCER 2017

NEXT STEPS

- Identify direction of further analysis, or if possible 4 to 5 target asset mixes for stochastic projections and stress testing
- Confirm stress test scenarios:
  - Market Correction: 33% decline in equity return, decline in yields
  - Inflation Shock: High inflation, higher yields and higher P/E Ratios
  - Inflationary Growth: higher yields, lower spreads
  - 1% Parallel Shift Up: Lower P/E Ratios, higher inflation
  - 1% Parallel Shift Down: Higher P/E Ratios, lower inflation
  - Deflation
- Mercer to prepare additional analysis, stochastic projections and stress testing
- Meeting to present and discuss results as well as recommendations for target asset mix going forward

© MERCER 2017

Duration	7.1	10.3	10.2	7.1	10.3	10.2
Hedge Ratio	69%	100%	99%	69%	100%	99%
Current Yield	2.1%	2.6%	2.4	2.1%	0.9%	1.0%

Note: Portfolio statistics shown are based on capital market assumptions outlined in the enclosed appendix. Nominal liability benchmark portfolio consists of 28% short provincial bonds, 18% mid-term provincial bonds and 54% long provincial bonds. Real liability benchmark portfolio comprised consists of 26% T-bills, 8% short provincial bonds and 66% real return bonds. Surplus volatility considers interest rate risk, market risk, and liability risk (assumed to be 3%) and assumes assets are equal to liabilities. Some figures may not add up due to rounding.

CAPITAL MARKET ASSUMPTIONS
BASIS OF MERCER'S ECONOMIC ASSUMPTIONS

- Mercer's capital market assumptions are intended to represent reasonable expectations for the next 10 to 20 years and incorporate a wide range of considerations including:
  - Historical return, risk and correlation statistics of broad indices
  - Fixed income returns based on projected yields implied by the current yield curve
  - Estimation of component returns to develop total equity returns, using as starting points such items as
    - Current level of equity earnings yield
    - Inflation expectations
    - Expected economic growth
  - Expected relative relationships between asset classes
  - Some forward-looking judgment
- In general, we assume that future returns will be consistent with assumed risk levels
- Our assumptions have not been developed in the sense of an economic forecast, but rather, to the extent possible, a reading of the market

© MERCER 2017

CAPITAL MARKET ASSUMPTIONS
BASIS OF MERCER'S ECONOMIC ASSUMPTIONS

- Note that:
  - All foreign asset class return, risk and correlation assumptions are based on unhedged foreign currency exposures
  - Publicly traded asset class returns are assumed to be index returns
  - Alternative asset class returns are assumed to be inclusive of median alpha (i.e., active management value-added) and net of median fees

© MERCER 2017

CAPITAL MARKET ASSUMPTIONS
SUMMARY OF MERCER'S VIEWS

Mercer's capital market assumptions are intended to represent reasonable long-term expectations given current market conditions

Assumptions are what we believe to be the median of the distribution of possible future long-term returns

Perceived mispricing in current financial market conditions should generally not be incorporated into long-term strategic allocation frameworks

Market inefficiencies should be exploited through the skill of specialist investment managers on a short-term basis and asset allocation tilts on a medium-term basis

In general, we assume that future returns will be consistent with assumed risk levels: riskier asset classes should be expected to provided higher returns

HEALTH WEALTH CAREER

ASSET LIABILITY STUDY

PHASE 2 SUMMARY DISCUSSION CORRECTED

Manitoba Public Insurance

Nov. 28, 2017

Angelo DiNoto
Dave Makarchuk
Pawel Piesowicz

AGENDA

- Recap of Phase 1
- Outline of Phase 2
- A Recommended Framework for Assessing Investment Decisions
- Analysis and Discussion for each Business Line
  - Overview of the Liabilities
  - Asset Class Objectives
  - Asset Class Options, Analysis and Recommendation
- Summary and Next Steps
- Appendix:
  - Efficient Frontiers
  - Capital Market Assumptions

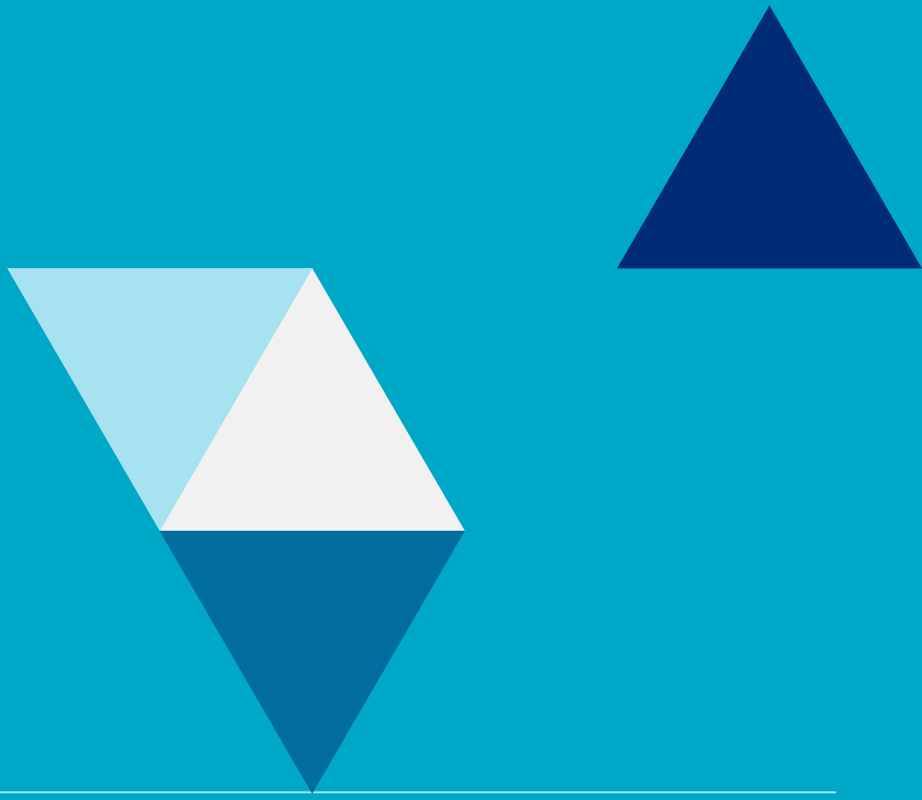
RECAP OF PHASE 1



© MERCER 2017

RECAP OF PHASE 1
KEY LEARNINGS AND CONCLUSIONS

Topic	Analysis/Discussion	MPI Conclusion
Should each business have a unique asset allocation?	The profile of the obligations and risk of each of the 5 businesses is unique. At a minimum, each business should be assessed individually. Preliminary recommendation is to adopt unique asset allocations.	Decision on whether to aggregate or segregate assets depends on dispersion of objectives.
What are MPI's Investment Goals?	The current IPS emphasizes mitigating risk resulting from interest rate variations and mitigating the risk of short-term premium volatility. It also indicates that minimizing premium levels is an objective. Clarifying investment goals for each business line is recommended.	Will define the purpose and objectives for each business line.
Inflation linkage of liabilities	Much of MPI's obligations are linked to future levels of inflation. Real return bonds are the best hedge for future inflation.	Given low inflation expectations, hedge nominal, but not real, interest rate risk.

© MERCER 2017

RECAP OF PHASE 1
KEY LEARNINGS AND CONCLUSIONS

Topic	Analysis/Discussion	MPI Conclusion
Merits of New Fixed Income Exposure	Reviewed the relative merits of Federal Bonds, Real Return Bonds, Private Debt, Corporate Bonds Commercial Mortgages, Levered Bonds, Growth Fixed Income. Analysis considered historical and expected risk and returns, duration matching potential, cost, implementation considerations.	Consider private debt and corporate bonds as new asset classes.
Interest Rate Risk Management Strategy	Discussed the merits of duration matching, cashflow matching, and a hybrid approach.	Focus on duration matching for 100% of Basic liabilities.
Economic Assumptions	Mercer's long-term assumptions assume a gradual rise in interest rates to a long-term equilibrium state. Alternatively, we are comfortable assuming shifts in future yields implied by current forward rates.	Projections and analysis will be based on implied forward rates.

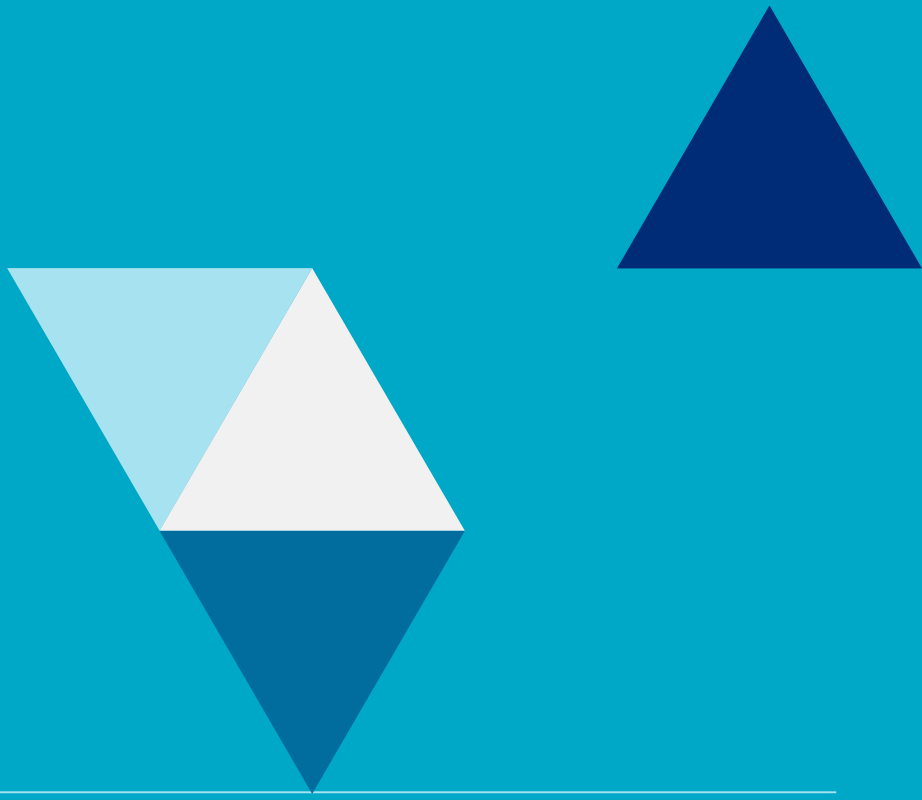
© MERCER 2017

RECAP OF PHASE 1
KEY LEARNINGS AND CONCLUSIONS

Topic	Analysis/Discussion	MPI Conclusion
Merits of New Growth Portfolio Exposure	Reviewed the relative merits of International Equities, Global Equities, Low Volatility Global Equities, Emerging Markets, Private Equity, and Diversified Growth Funds.	Consider allocations to Global Equities (including Emerging Markets), Low Volatility Global Equities, and Private Equities.

© MERCER 2017

PHASE 2 OBJECTIVES



© MERCER 2017

PHASE 2 OBJECTIVES

Objective	Comments
1.Analyze characteristics and risks of claim liabilities, pension liabilities, equities.	See phase 1 for initial analysis discussion. Further analysis/discussion herein.
2. Quantify risk and return under current and alternative mixes.	Included in this report.
3. Assess available asset classes and impact of adding those new asset classes.	Available asset classes assessed in Phase 1. Impact of new asset classes assessed in this report.
4.Evaluate probability of meeting expected returns under various economic scenarios.	Included in this report.

© MERCER 2017

PHASE 2 OBJECTIVES

Objective	Comments
5. Assess asset class optimization with 1). Minimal constraints and 2). Practical implementation considerations.	Assessment with minimal constraints preceded this report. This report focuses on practical alternatives.
6. Recommend normal, minimum, and maximum allocations to each asset class.	This report focusses on normal allocations. Recommend +/- 3-5% for minimums/maximum's alongside rebalancing.
7. Recommend asset allocations that maximize the probability of achieving corporate goals within stated constraints.	Included in this report.
8. Recommend an allocation to Corporate Bonds	Included in this report.

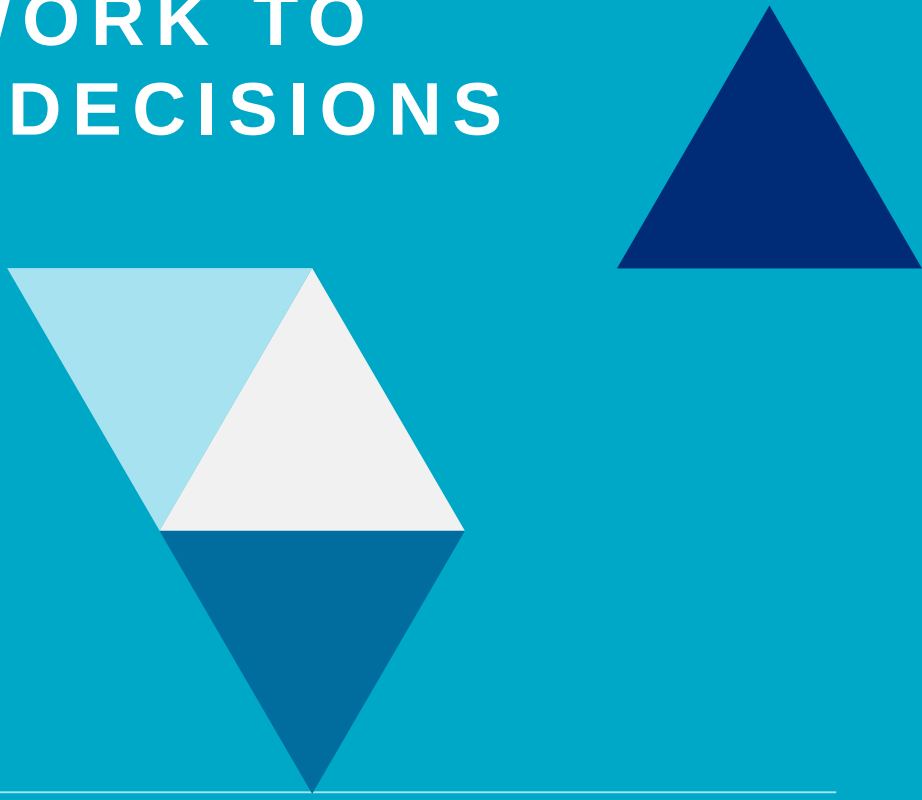
A PROPOSED FRAMEWORK TO ASSESS INVESTMENT DECISIONS



© MERCER 2017

Deciding when, and how, to innovate and change is an ongoing challenge for investment fiduciaries.

Adopting a structured, but simple, decision making framework can help investment fiduciaries prioritize their Investment Innovation Budget … and improve outcomes.

© MERCER 2017

WHY DO WE MAKE INVESTMENT DECISIONS?

We make investment decisions to deliver better outcomes

One's perception of a 'Better Outcome' can vary significantly

Identifying, and articulating, desired outcomes is a crucial fiduciary responsibility

© MERCER 2017

EVERY INVESTMENT DECISION WE DO (OR DO NOT) MAKE IS DRIVEN BY 4 KEY FACTORS…

Return

Risk

Cost

Time

© MERCER 2017

THESE 4 FACTORS FORM THE FOUNDATION OF A LEVERAGABLE DECISION MAKING FRAMEWORK

Return

How does this change impact expected returns?

Risk

How does this change impact expected risk?

Cost

How much does this change cost?

Time

How much time will this change take?

© MERCER 2017

A SAMPLE USE OF THE FRAMEWORK TO ASSESS THE MERITS OF AN OVERALL ASSET MIX RECOMMENDATION HELPS ILLUSTRATE KEY DECISIONS

	Asset Mix A	Asset Mix B
Return 	Expected Return increases by $35Million/annum	Expected Return increases by $5Million/annum
Risk 	Value at Risk increases by $10Million	Value at Risk decreases by $10Million
Cost 	Expected Implementation and Oversight costs increase by $5Million/annum	Expected Implementation and Oversight costs increase by $1Million/annum
Time 	2 years to implement 1 additional staff member 2 additional committee meetings	6 months to implement No change in staff

© MERCER 2017

CONFIRMING PURPOSE IS IMPORTANT!

HOW SHOULD MPI PRIORITIZE ITS INVESTMENT INNOVATION BUDGET? WHY?

Return

To improve returns?

Risk

To embrace, mitigate, or eliminate risk?

Cost

To reduce (optimize) cost?

Time

To make better use of time?

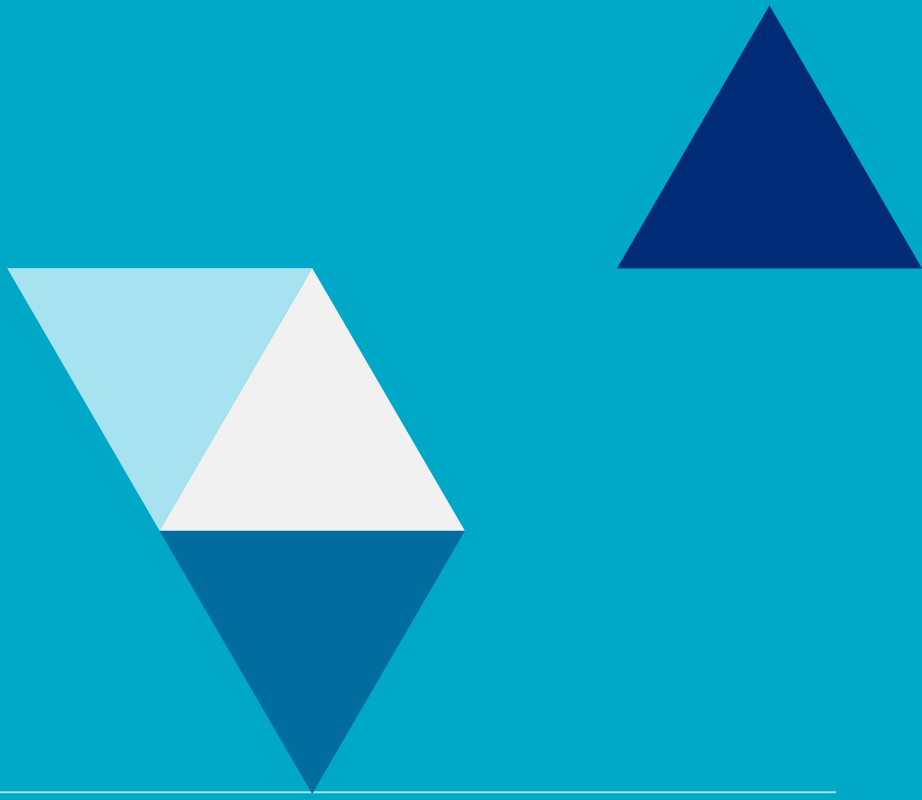
© MERCER 2017

ARTICULATING MPI'S OBJECTIVES FOR EACH BUSINESS LINE HELPS CLARIFY THE 'PURPOSE' AND PRIORITIES … FOR INVESTMENT INNOVATION

	Basic	Extension	SRE	RSR	Pension
Return 					
Risk 					
Cost 					
Time 					

© MERCER 2017

BASIC
LIABILITIES, ASSET ALLOCATION ALTERNATIVES, AND RECOMMENDATION



© MERCER 2017

A SNAPSHOT OF MPI'S BASIC LIABILITIES

Liability Overview

- Basic universal compulsory automobile insurance for Manitoban drivers
- Rates are approved by the Public Utilities Board of Manitoba
- Obligations are a mix of:
  - Long-term payments (typically disability claims indexed to inflation), and
  - Short-term payments (typically damage repairs)

Key Statistics

Liability: $1.79Billion

Duration: 10.5 years

Liability Benchmark

- Short Provincial Bonds 28%
- Mid Provincial Bonds 18%
- Long Provincial Bonds 54%

Asset Purpose:

Ensure that MPI's claim liabilities are paid to the rate payer as they come due

Risk Tolerance

Very low. If RSR grows in future, risk tolerance could increase.

© MERCER 2017

ASSET CLASS OBJECTIVES
BASIC

Return

- Mitigating risk is more important than maximizing returns
- Willing to pursue modest incremental returns through diversified credit decisions
- Avoiding federal treasuries (no credit reward)
- Return target : ___ %/annum ($___ Million on $1.79Bilion)
-

Risk

- Mitigating risk is more important than maximizing returns
- Matching $ duration is key … no willingness to take interest rate risk
- Willing to take modest credit risk (so long as its diversified and cost effective)
- Unacceptable 1 year investment loss: $___Million on $1.79Billion

• ASSET CLASS RECOMMENDATION
BASIC: MPI RECOMMENDATION IS BASIC.3

- Assuming:
  - Matching interest rate risk remains the priority for Basic,
  - MPI will accept some credit risk in pursuit of modest levels of excess returns,
- We would support allocating to Basic.3 or Basic.4, with a preference for Basic.4
  - Basic.4: 60% Provincials, 20% MUSH, 10% Corporates, 10% Private Debt
    1. High excess return to surplus volatility ratio (risk-adjusted return)
    2. High probability of surplus and positive real return
    3. High non-MUSH yield
    4. Low surplus volatility
    5. More diversified fixed income portfolio

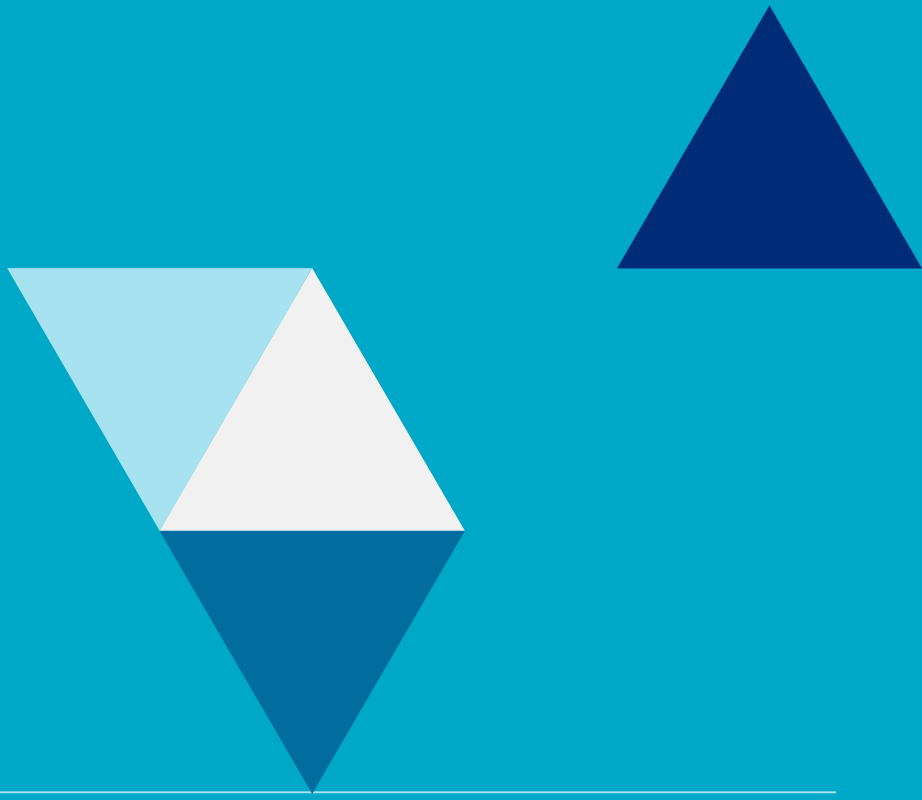
© MERCER 2017

ABOUT THE BASIC PROJECTIONS

- The starting point of this analysis is based on:
  - Assets of $1,790M
  - Liabilities of $1,790M
- **Liability growth rate** is assumed to be at Liability Benchmark growth rate. The future discount rate is assumed to be changing in line with the yield on the Liability Benchmark.
- **Surplus volatility** reflects volatility of the Liability Benchmark, volatility of assets, as well as correlation between the two.
- The projection assumes **no future underwriting losses or gains**
- The projection assumes that over the 5-year period new business premiums will be roughly equal to overall claim payments, so the **inflows will offset the outflows**
- Hedge ratio for alternative asset mixes reflects modelling of pure basic component, **assuming assets equal liabilities**.
- Capital market assumptions are outlined in the Appendix.

© MERCER 2017

RSR
LIABILITIES, ASSET ALLOCATION ALTERNATIVES, AND RECOMMENDATION



© MERCER 2017

A SNAPSHOT OF MPI'S RATE STABILIZATION RESERVE (RSR)

Liability Overview

- RSR is essentially surplus assets and excludes AOCI
- RSR transfers to become a claim liability if claim experience (investment or otherwise) is unfavorable
-

Key Statistics

Assets: $97.8Million

Duration: 0 years

Liability Benchmark

- Not Applicable

Asset Purpose:

Stabilize insurance rates by covering losses when they emerge

Risk Tolerance

Minimal if RSR is below DCAT minimum.

Moderate when within optimal range

© MERCER 2017

ASSET CLASS OBJECTIVES
RSR

Return

- Generating real returns helps stabilize premium rates and grow surplus
- Return objectives are more conservative when surplus is less than DCAT minimum

Risk

- No specific obligations exist, allowing for more flexibility with regard to fixed income duration, growth assets, and liquidity
- Risk aversion increases when surplus is less than DCAT minimum

© MERCER 2017

ASSET CLASS RECOMMENDATION
RSR: MPI RECOMMENATION IS R-S-E.1

- It is our understanding that the RSR is currently less than the DCAT minimum, suggesting consideration of the more conservative mixes RSR.1 and R-S-E.1
- We would support allocating to either, with a preference for R-S-E.1 (50% Fixed Income, 50% Growth)
    1. High Sharpe ratio (risk-adjusted return)
    2. High probability of positive real return
    3. Relative to RSR.1's 5-year projection, materially more upside than downside

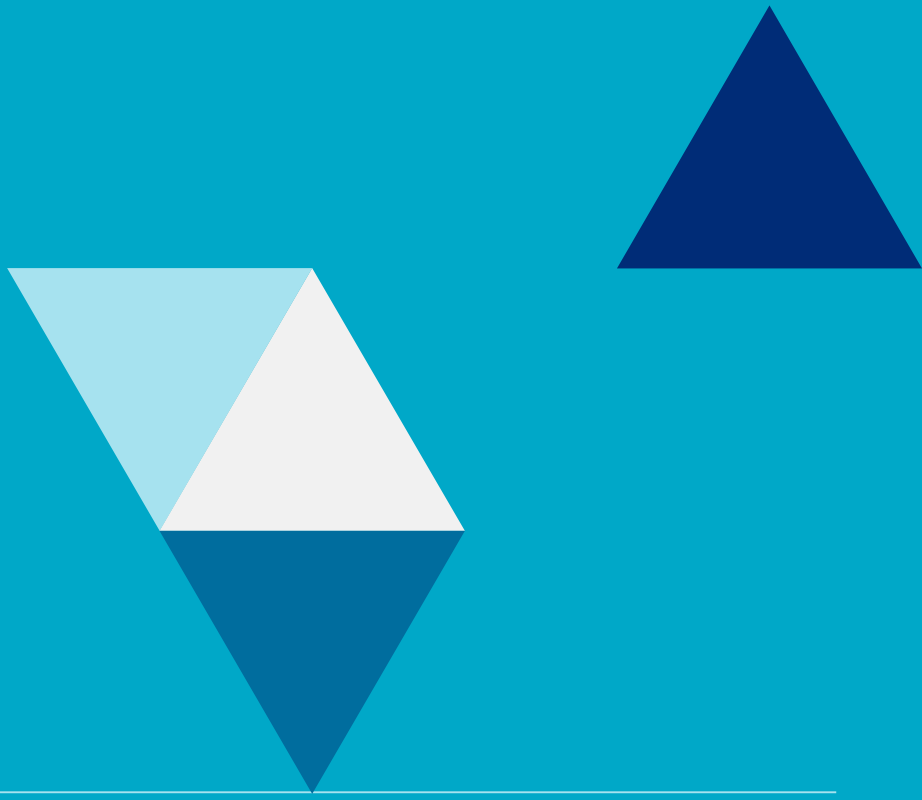
© MERCER 2017

ABOUT THE RSR PROJECTIONS

- The starting point of this analysis is based on:
  - Assets of $97.8M
  - No liabilities
- **Portfolio growth rate** is assumed to be portfolio's expected return.
- **Return volatility** is based on portfolio composition.
- Capital market assumptions are outlined in the Appendix.

© MERCER 2017

PENSION



© MERCER 2017

A SNAPSHOT OF MPI'S PENSION LIABILITIES

Liability Overview

- Employer share of pension plan liabilities are funded on a pay as you go basis
- Liability represents amounts that have been accrued but not paid

Key Statistics

Liability: $405 Million

Duration: 15.6 years

Liability Benchmark

- Treasury Bills -17%
- Long Corporates Bonds 117%

Asset Purpose:

Ensure that MPI's pension obligations are paid as they become due

Risk Tolerance

Moderate

© MERCER 2017

ASSET CLASS OBJECTIVES
PENSION

Return

- Consider CSSB asset mix as a starting point (if MPI didn't fund PAYGO, this is how assets would be invested)

Risk

- Changes in pension liability (often driven by long corporate yields) requires 'truing up' ... When long corporate rates fall/(rise), the businesses must fund/(release) reserves

© MERCER 2017

© MERCER 2017

ASSET CLASS RECOMMENDATION
PENSION: MPI RECOMMENDATION IS PENSION.1

- If hedging interest rate risk is important, we would support allocating to Pension.1
    1. Highest interest rate risk hedge
    2. Probability of surplus and positive real return doesn't improve in Pension.2 or 3
    3. Relative to CSSB's 5-year projection, less volatility with similar return

© MERCER 2017

ABOUT THE PENSION PROJECTIONS

- The starting point of this analysis is based on:
  - Assets of $405M
  - Liabilities of $405M (based on MPI discount rate of 3.89%)
- **Liability growth rate** is assumed to be 3.89%. The future discount rate is assumed to be changing in line with the yield on the Liability Benchmark.
- **Surplus volatility** reflects volatility of the Liability Benchmark, volatility of assets, as well as correlation between the two.
- The projection assumes that over the 5-year period the **inflows will offset the outflows.**
- Capital market assumptions are outlined in the Appendix.

CAPITAL MARKET ASSUMPTIONS
10-YEAR ASSUMPTIONS

	Asset Class	Median 10 year return	Standard deviation
1	Treasury Bills	1.4%	1.5%
2	Federal short-term bonds	1.9%	3.5%
3	Federal mid-term bonds	2.1%	6.5%
4	Federal long-term bonds	2.0%	8.5%
5	Real return bonds	2.7%	7.5%
6	Provincial short-term bonds	2.3%	3.5%
7	Provincial mid-term bonds	2.8%	6.5%
8	Provincial long-term bonds	3.0%	8.5%
9	Corporate short-term bonds	2.8%	3.5%
10	Corporate mid-term bonds	3.5%	6.5%
11	Corporate long-term bonds	3.8%	8.5%
12	Global bonds	0.8%	8.6%
13	High yield bonds	3.9%	9.5%
14	Emerging debt	6.8%	12.0%
15	Canadian equity (large cap.)	6.7%	19.5%
16	U.S. equity (large cap.)	6.7%	17.0%
17	Int'l equity (large cap.)	6.7%	17.1%
18	Global equity (large cap.)	6.7%	16.1%
19	Global low vol equity	6.1%	13.0%
20	Emerging equity	8.7%	25.0%
21	Private equity	10.1%	25.0%
22	Real estate	5.4%	13.0%
23	Diversified Growth Fund	4.9%	9.8%
24	Direct Infrastructure	6.2%	13.0%
25	MUSH Bonds	3.0%	6.5%
26	Commercial Mortgages	2.7%	3.5%
27	Long Commercial Mortgages	2.5%	5.3%
28	Private Debt - Universe	3.3%	5.4%
29	Private Debt - Long	3.5%	8.5%

Inflation: 2.0%

Fixed income returns based on projected yields implied by the current forward yield curve.

Source: Mercer's Canadian long-term capital market assumptions (August 31, 2017). Expected return represents expected return over the next 10 years.
Note: 3X Long Provincial Bonds is defined as 300% Provincial Long Bonds less 200% Treasury Bills and a 0.7% leverage cost. 3X Real Return Bonds is defined as 300% Real Return Bonds less 200% Treasury Bills and a 0.7% leverage cost.

CAPITAL MARKET ASSUMPTIONS
BASIS OF MERCER'S ECONOMIC ASSUMPTIONS

- Mercer's capital market assumptions are intended to represent reasonable expectations for the next 10 to 20 years and incorporate a wide range of considerations including:
  - Historical return, risk and correlation statistics of broad indices
  - Fixed income returns based on projected yields implied by the current yield curve
  - Estimation of component returns to develop total equity returns, using as starting points such items as
    - Current level of equity earnings yield
    - Inflation expectations
    - Expected economic growth
  - Expected relative relationships between asset classes
  - Some forward-looking judgment
- In general, we assume that future returns will be consistent with assumed risk levels
- Our assumptions have not been developed in the sense of an economic forecast, but rather, to the extent possible, a reading of the market

© MERCER 2017

CAPITAL MARKET ASSUMPTIONS
BASIS OF MERCER'S ECONOMIC ASSUMPTIONS

- Note that:
  - All foreign asset class return, risk and correlation assumptions are based on unhedged foreign currency exposures
  - Publicly traded asset class returns are assumed to be index returns
  - Alternative asset class returns are assumed to be inclusive of median alpha (i.e., active management value-added) and net of median fees

© MERCER 2017

CAPITAL MARKET ASSUMPTIONS
SUMMARY OF MERCER'S VIEWS

Mercer's capital market assumptions are intended to represent reasonable long-term expectations given current market conditions

Assumptions are what we believe to be the median of the distribution of possible future long-term returns

Perceived mispricing in current financial market conditions should generally not be incorporated into long-term strategic allocation frameworks

Market inefficiencies should be exploited through the skill of specialist investment managers on a short-term basis and asset allocation tilts on a medium-term basis

In general, we assume that future returns will be consistent with assumed risk levels: riskier asset classes should be expected to provided higher returns

ASSET LIABILITY STUDY

PRELIMINARY EFFICIENT FRONTIER ANALYSIS FOR BASIC INSURANCE COMPONENT

DISCUSSION DRAFT

Manitoba Public Insurance

OCTOBER 30, 2017

Angelo DiNoto
Pawel Piesowicz
Jared Mickall
Dave Makarchuk

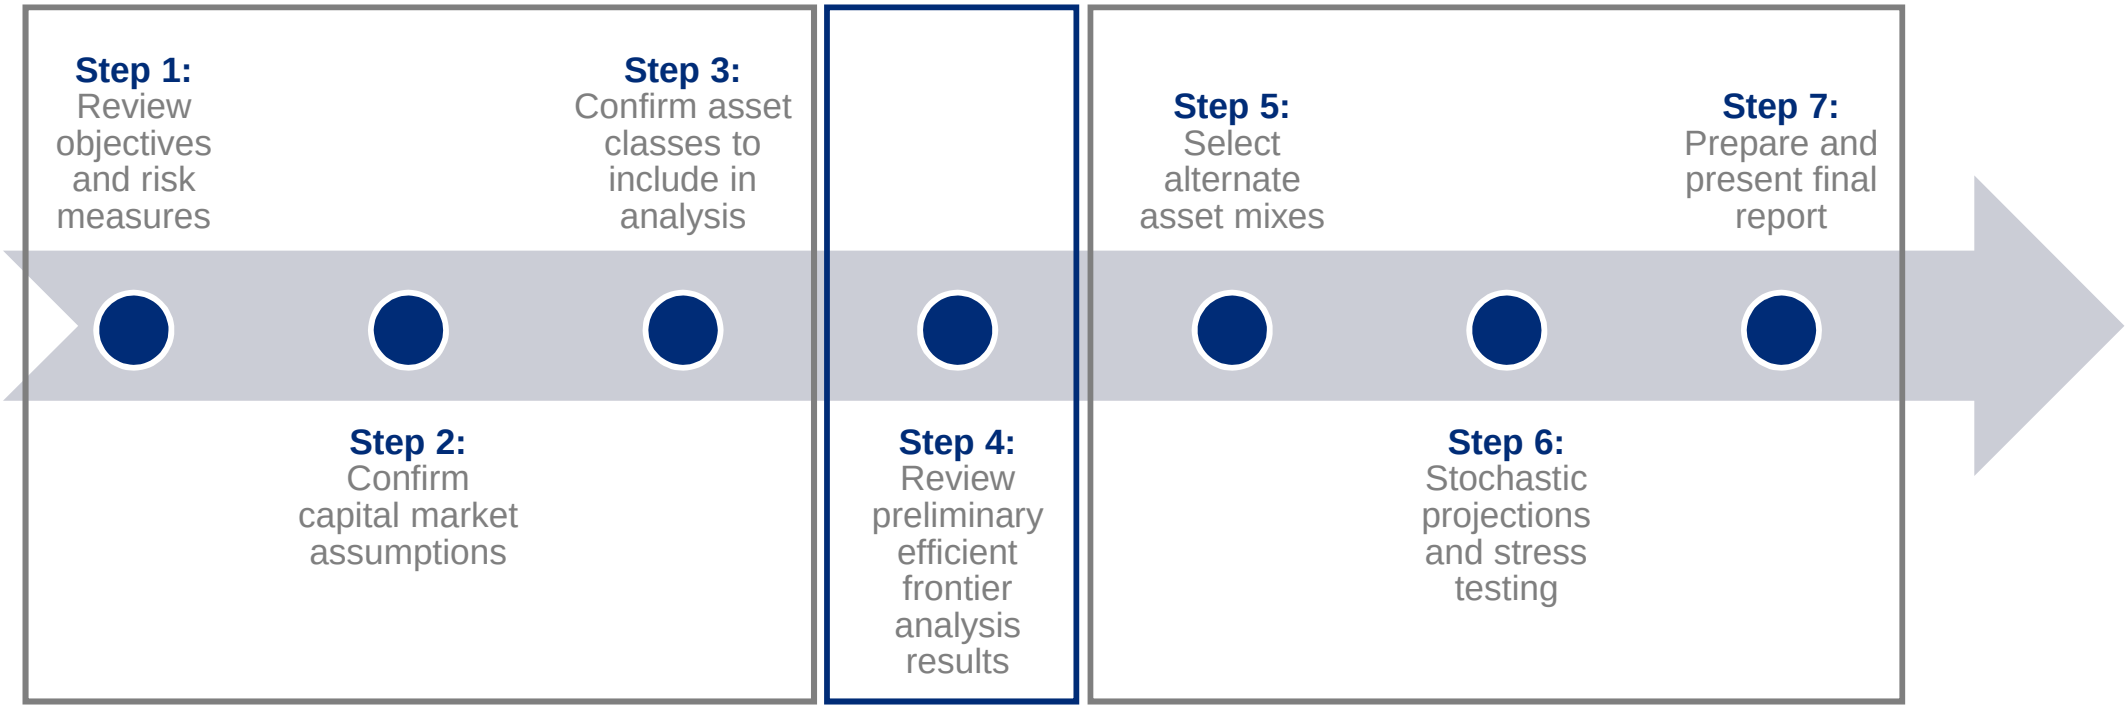
Updated Nov. 8, 2017

TODAY'S MEETING AGENDA

- Summary of discussions to date:
  - Proposed asset classes
  - Proposed constraints
- Review results of the efficient frontier analysis
- Key goals:
  - Generate discussion on the direction of potential asset mix changes
  - Confirm range of asset mixes to include in the analysis
  - Possibly identify 4 to 5 strategic target asset mixes for further analysis
- Discussion and next steps
- Appendices
  - Comparison to other financial institutions
  - Capital Market Assumptions

© MERCER 2017

ASSET LIABILITY STUDIES PROCESS



Kick-Off Meeting
Risk metrics
Asset classes to include in analysis
Capital market assumptions
(Oct. 13th Meeting)

Preliminary Analysis
Efficient Frontiers
(Today's Meeting)

Final Analysis (By Nov. 30th)

SUMMARY OF DISCUSSIONS TO DATE
ASSET CLASSES

© MERCER 2017

ASSET CLASSES CONSIDERED
BASIC, EXTENSION, SRE, RSR, PENSION

	Return Seeking	Inflation Sensitive	Interest Rate Sensitive
Broad Markets	**Canadian Equity** US Equity **EAFE Equity**	Real Return Bonds 3x Real Return Bonds	Cash MUSH Bonds Provincial Bonds Federal Bonds Canadian Corporate Bonds 3X Long Provincial Bonds
Other Markets	Emerging Markets Equity Global Low Volatility Equity		Global Bonds High Yield Bonds Emerging Market Debt
Alternative Investments	Private Equity Diversified Growth Fund	Infrastructure – Direct Global Real Estate - Direct Cdn	Private Debt – Universe Private Debt – Long Commercial Mortgages Long Comm. Mortgages

Asset Class descriptions along with pros/cons are in the Appendix.

Asset classes already included in the target asset mix

Additional asset classes included in the analysis as suggested by Mercer (approved by MPI Investment Committee)

© MERCER 2017

ASSET CLASSES TO CONSIDER CONSTRAINTS

- Practical and reasonable modelling approaches and constraints are necessary. Mercer recommendations on modelling are as follows:

  ü U.S./EAFE/Emerging Markets Equity should be bundled into a single ACWI[1] equity mandate
  - Single ACWI mandate provides greater mandate efficiency, affordability
  - Expands equities to include Emerging Markets Equity (note: Samsung is an example)
  - Allows the manager to select best in class stocks without artificial geographic boundaries (i.e., attaching a multinational company to a single country)

  ü Global Bonds/High Yield Bonds/Emerging Market Debt (one-third each), hereafter referred to as Growth Fixed Income
  - Diversified package of liquid bonds which diversifies return and risk sources of the Growth Portfolio

ACWI is All Country World Index. MSCI ACWI is currently about 52% US, 32% EAFE, 12% Emerging Markets Equity

© MERCER 2017

ASSET CLASSES TO CONSIDER
MINIMALLY CONSTRAINED APPROACH - PARAMETERS

Current

Asset Class	Single	Group
MUSH Bonds	Max. 25% of total portfolio	
Real Estate and Infrastructure		Not exceed 50% of U.S. Equity, Real Estate, Infrastructure

Proposed by Mercer

Asset Class	Single	Group
MUSH Bonds Private Debt Commercial Mortgages	Min. 10% of total portfolio	Max. 25% of total portfolio
Real Estate Infrastructure Private Equity Growth Fixed Income		Not exceed Equity portfolio

PRELIMINARY ANALYSIS
EFFICIENT FRONTIERS
BASIC INSURANCE – NOMINAL LB

© MERCER 2017

EFFICIENT FRONTIERS
OVERVIEW

- Characteristics of the efficient frontier tool:
  - One year time horizon
  - Incorporates liabilities through use of a “liability benchmark”
  - Uses optimization techniques to determine asset mixes with optimal risk/return characteristics
  - Flexible tool that can be used to quickly consider many asset mixes
  - Outputs include expected returns and surplus volatility
- Useful for identifying portfolios that:
  - Minimize surplus volatility for a specified level of expected growth; or
  - Maximize expected growth for a specified level of surplus volatility

Note:

- Surplus volatility (i.e., standard deviation) is a measure of the expected volatility of financial position and is expressed on an annualized basis as a percentage of assets
- Surplus volatility of 10% means that there is, roughly, a 1 in 6 chance that the financial position will be:
  - Worse than expected by more than 10% of the starting asset value
  - Better than expected by more than 10% of the starting asset value

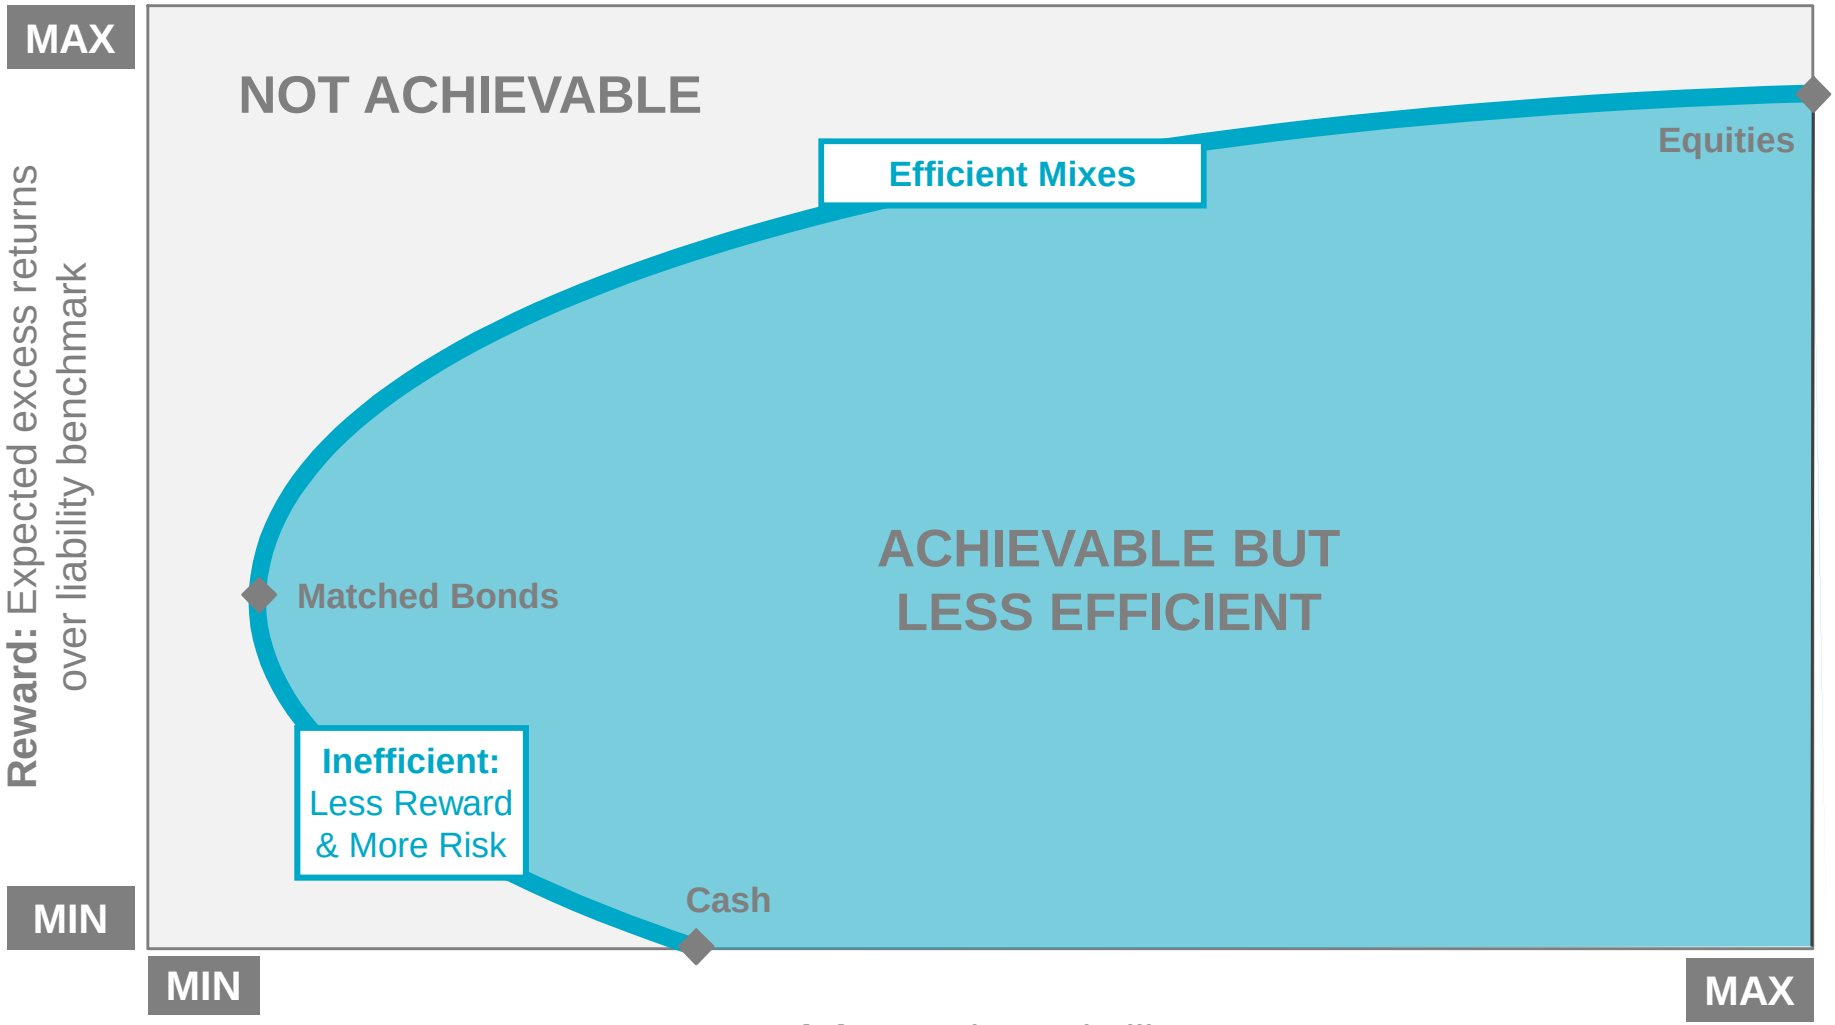
EFFICIENT FRONTIERS

ASSET-LIABILITY EFFICIENT FRONTIER



© MERCER 2017

INTEREST RATE RISK
LIABILITY BENCHMARK

- In order to evaluate financial risks and to find portfolios that will minimize them, we develop a fixed income portfolio that reproduces the fluctuations of the liabilities (called the Liability Benchmark)
- Based on information provided by Manitoba Public Insurance, the duration and the liability benchmark portfolios for Basic Insurance liabilities (unpaid claims) are summarized below:

	Nominal[1]	Real[2]
Duration	10.3 years	10.3 years
Liability Benchmark		
• Treasury Bills	--	26%
• Short Provincial Bonds	28%	8%
• Mid Provincial Bonds	18%	--
• Long Provincial Bonds	54%	--
• Real Return Bonds	--	66%

Note: These figures are preliminary and may be refined as part of the study.

[1] Nominal considers fixed future inflation at 2% p.a.
[2] Real reflects sensitivity to future inflation rates

© MERCER 2017

INTEREST RATE RISK
DURATION AND HEDGE RATIO

- Interest rate and inflation risk arise from the fact that a change in market interest rates and/or inflation rates may change liabilities differently than assets
  - A commonly used measure of interest rate sensitivity, “duration”, measures the percentage change in assets and liabilities for each 1% change in market interest rates
  - As an example, a liability “duration” of 10 years means that for each 1% rise (fall) in interest rates, the liabilities are expected to decrease (increase) by approximately 10%
- The interest rate hedge ratio, which measures how much of interest rate risk is hedged, depends on three factors:
  - Ratio of assets to liabilities
  - Percentage of assets allocated to the liability matching portfolio
  - Duration of the matching portfolio relative to that of the liabilities

How much interest rate risk is currently hedged for the Basic Insurance component (assuming assets are equal to liabilities)?

70%
assets allocated to matching portfolio

✖

10.2 years
duration of matching portfolio

÷

10.3 years
duration of liabilities

=

69%

© MERCER 2017

RISK MANAGEMENT
INVESTMENT LEVERS

Lever 1

- Allocation between growth and hedging assets
- Perhaps most important decision, which is often determined by ability and willingness to accept risk

		Target Mix
Hedging	Marketable Bonds	50%
	Non-Marketable Bonds	20%
	Predominately Manitoba Schools and Non-Manitoba Provincial bonds	
	Approximately 2% each to Federal bonds and Corporate bonds	
	Subtotal	**70%**
Growth	Canadian Equity	10%
	US Equity	5%
	EAFE Equity	0%
	Canadian Real Estate	10%
	Infrastructure	5%
	Private Equity	0%
	Subtotal	**30%**
Total		**100%**

Lever 2 (Hedging portfolio structure)

- Structure of the fixed income portfolio affects interest rate risk (not all bonds are created equal)
- e.g., real return bonds can offset inflation risk

Lever 3 (Growth portfolio structure)

- Diversifying the growth portfolio can improve its risks / reward characteristics

Other Levers

- Currency hedging, leverage, alpha transport, tactical asset allocation, etc.

EFFICIENT FRONTIERS (MINIMALLY CONSTRAINED)
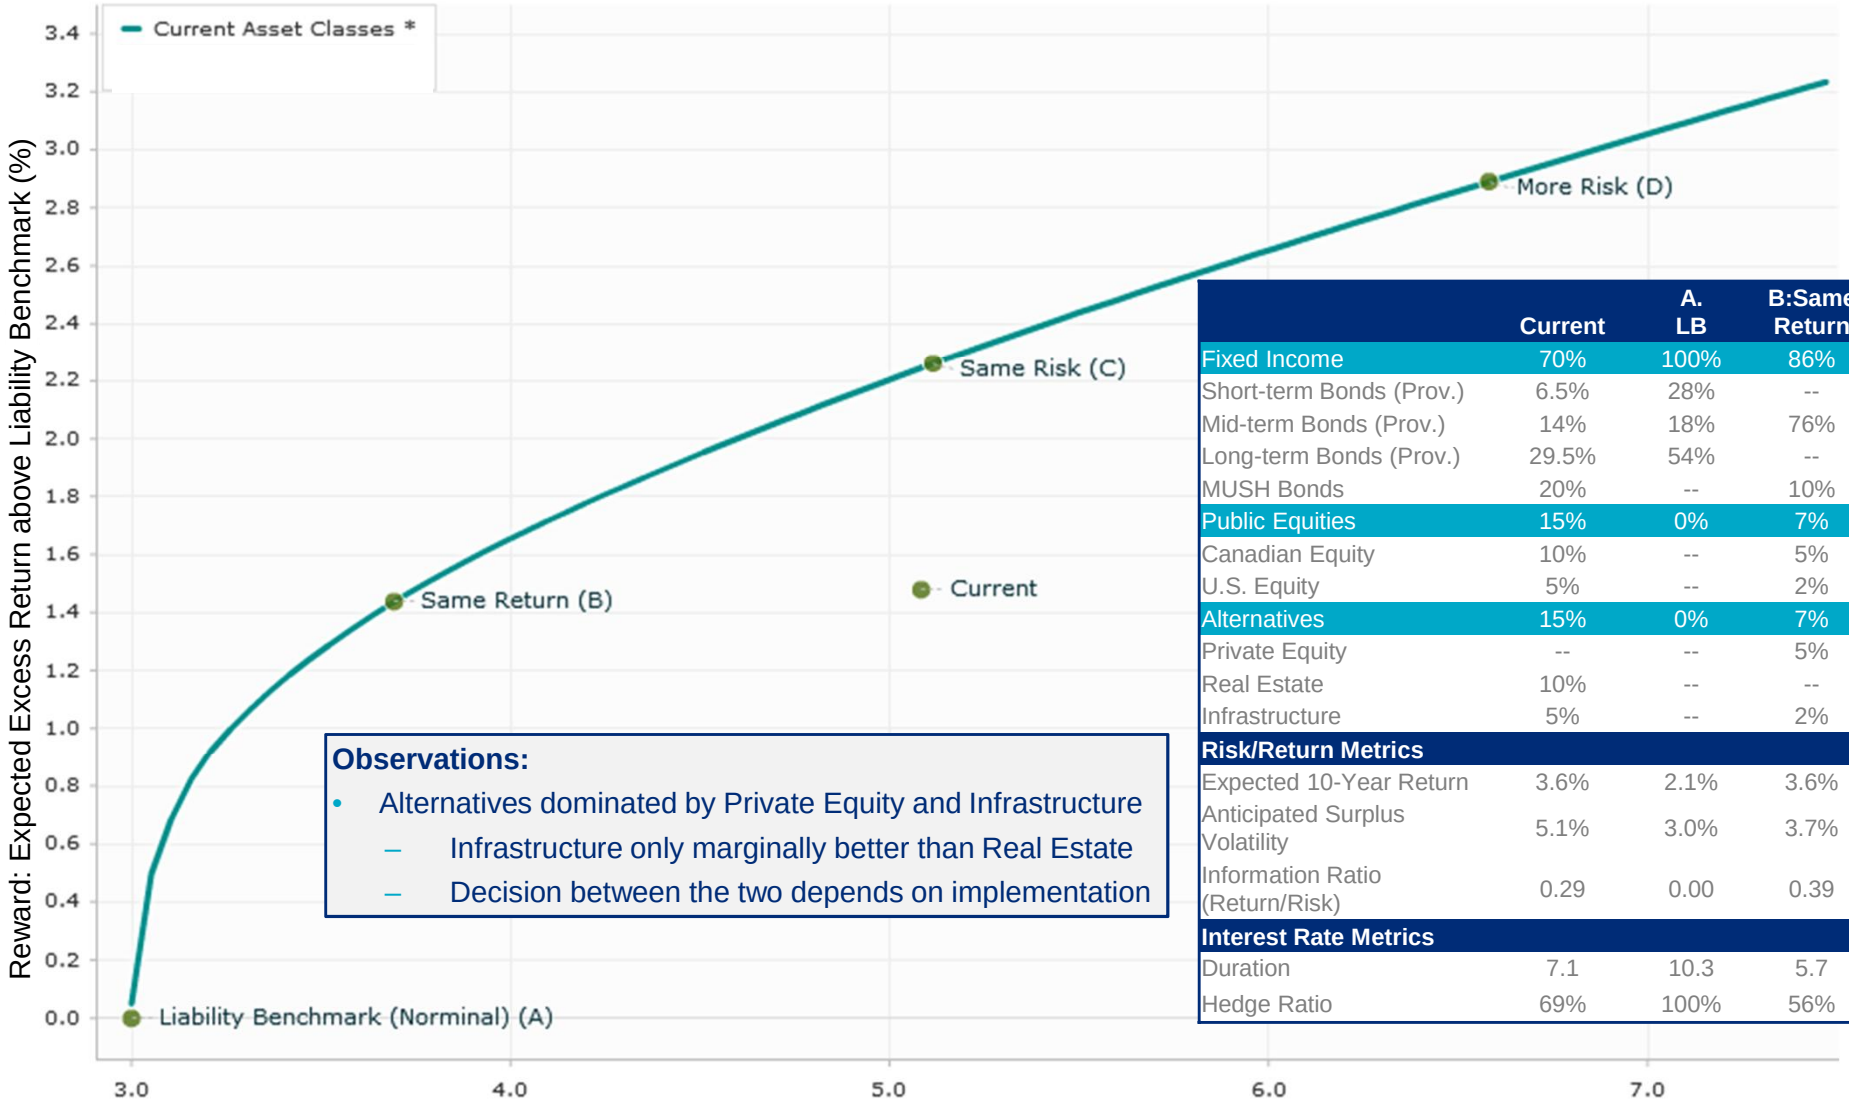
ADDING PRIVATE EQUITY



Observations:

- Alternatives dominated by Private Equity and Infrastructure
  - Infrastructure only marginally better than Real Estate
  - Decision between the two depends on implementation

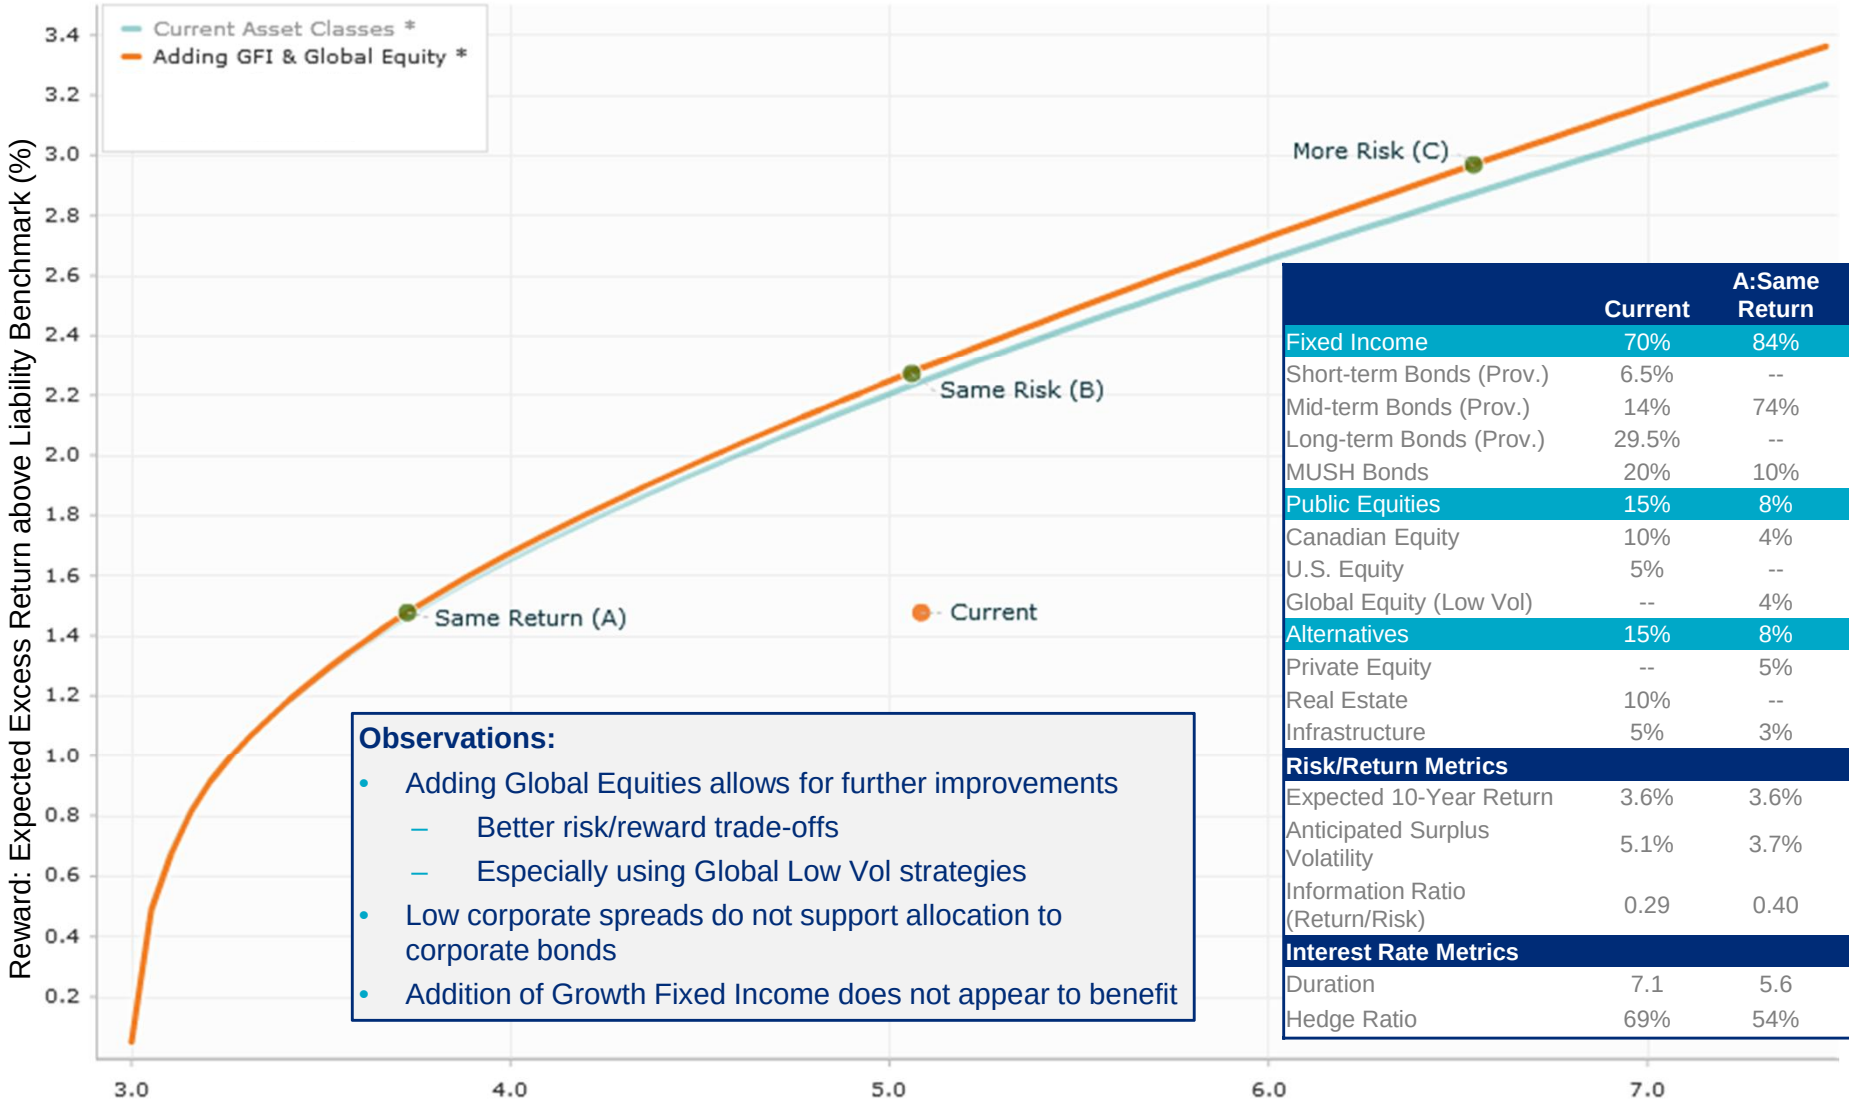
EFFICIENT FRONTIERS (MINIMALLY CONSTRAINED)
ADDING GROWTH FIXED INCOME & GLOBAL EQUITIES



Observations:

- Adding Global Equities allows for further improvements
  - Better risk/reward trade-offs
  - Especially using Global Low Vol strategies
- Low corporate spreads do not support allocation to corporate bonds
- Addition of Growth Fixed Income does not appear to benefit

ADDITIONAL COMMENTS
REAL RETURN BONDS

- Currently, RRBs offer relatively attractive inflation protection.
- This is best understood by calculating the total expected yield of an RRB and then comparing it to a conventional bond with the same quality and maturity. Below we consider 30-year Government of Canada Bonds:

RRB Real Yield	0.6%
30-year BEIR[1]	1.6%
Total Yield	2.2%
30-year conventional bond yield	2.3%

- The Canadian RRB market is fairly large and liquid. There are currently 15 outstanding issuances, among which eight were issued by the Government of Canada and 7 are provincial issuances.
- RRBs issued by the Government of Canada are the most liquid and currently have a total market value of about $72 Billion.
- Finally, it is worth noticing that despite RRBs offering attractive inflation protections, the expected return on RRBs is below its long-term historical levels with a current real yield of 0.60%.

[1] BEIR is the Break Even Inflation Rate which is calculated as the difference between a conventional bond and an RRB. The BEIR can be interpreted as the capital markets expectation on future inflation.

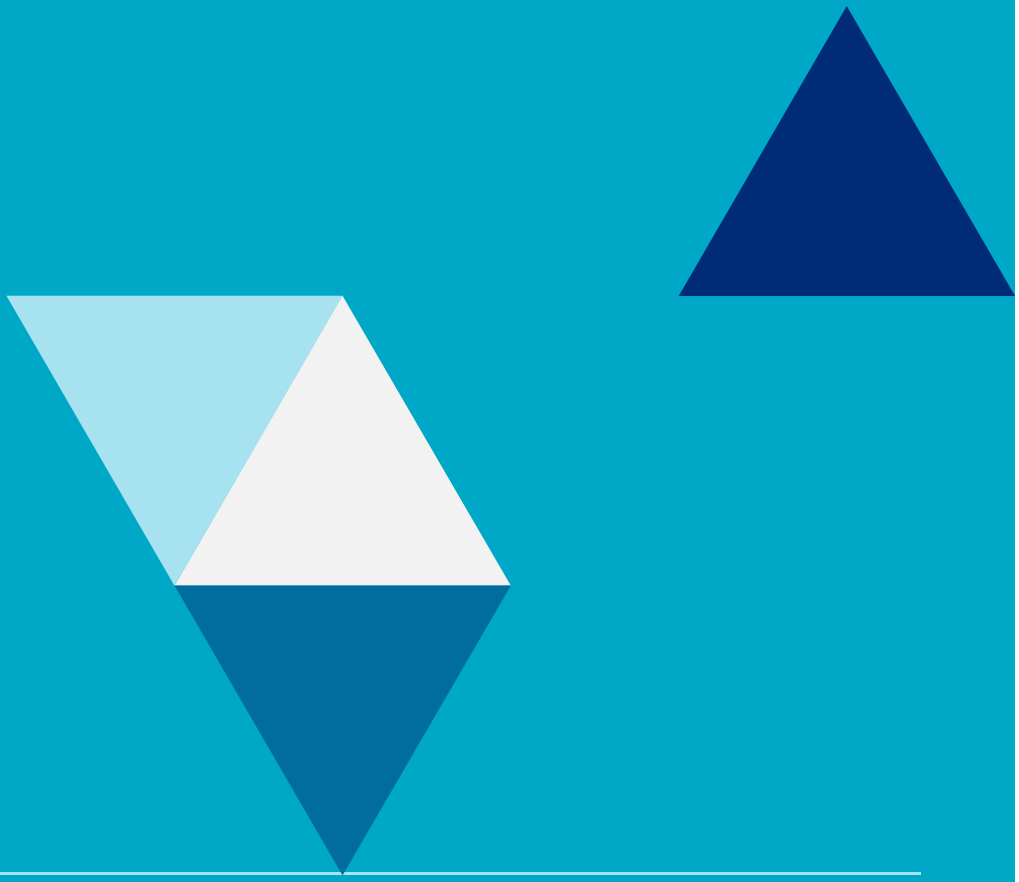
NEXT STEPS



© MERCER 2017

NEXT STEPS
KEY DECISIONS

- Risk or reward: where feasible, is the preference to:
  - Reduce risk (keeping expected return at current level)?
  - Increase expected return (keeping risk at current level)?
  - Something in between?
  - Increase risk and expected return?

- Degree of comfort with:
  - With changes to current portfolios
  - Interest rate hedging

© MERCER 2017

NEXT STEPS

- Identify direction of further analysis, or if possible 4 to 5 target asset mixes for stochastic projections and stress testing
- Confirm stress test scenarios:
  - Market Correction: 33% decline in equity return, decline in yields
  - Inflation Shock: High inflation, higher yields and higher P/E Ratios
  - Inflationary Growth: higher yields, lower spreads
  - 1% Parallel Shift Up: Lower P/E Ratios, higher inflation
  - 1% Parallel Shift Down: Higher P/E Ratios, lower inflation
  - Deflation
- Mercer to prepare additional analysis, stochastic projections and stress testing
- Meeting to present and discuss results as well as recommendations for target asset mix going forward

Note: Portfolio statistics shown are based on capital market assumptions outlined in the enclosed appendix. Nominal liability benchmark portfolio consists of 28% short provincial bonds, 18% mid-term provincial bonds and 54% long provincial bonds. Real liability benchmark portfolio comprised consists of 26% T-bills, 8% short provincial bonds and 66% real return bonds. Surplus volatility considers interest rate risk, market risk, and liability risk (assumed to be 3%) and assumes assets are equal to liabilities. Showed allocation of Saskatchewan Auto Fund for comparison only and using the MPI real liability benchmark. Some figures may not add up due to rounding.

Its content may not be modified, sold or otherwise provided, in whole or in part, to any other person or entity, without Mercer's prior written permission.

The findings, ratings and/or opinions expressed herein are the intellectual property of Mercer and are subject to change without notice. They are not intended to convey any guarantees as to the future performance of the investment products, asset classes or capital markets discussed. Past performance does not guarantee future results. Mercer's ratings do not constitute individualized investment advice.

Information contained herein has been obtained from a range of third party sources. While the information is believed to be reliable, Mercer has not sought to verify it independently. As such, Mercer makes no representations or warranties as to the accuracy of the information presented and takes no responsibility or liability (including for indirect, consequential or incidental damages), for any error, omission or inaccuracy in the data supplied by any third party.

This does not constitute an offer or a solicitation of an offer to buy or sell securities, commodities and/or any other financial instruments or products or constitute a solicitation on behalf of any of the investment managers, their affiliates, products or strategies that Mercer may evaluate or recommend.

For the most recent approved ratings of an investment strategy, and a fuller explanation of their meanings, contact your Mercer representative.

For Mercer's conflict of interest disclosures, contact your Mercer representative or see www.mercer.com/conflictsofinterest.

Mercer universes: Mercer's universes are intended to provide collective samples of strategies that best allow for robust peer group comparisons over a chosen timeframe. Mercer does not assert that the peer groups are wholly representative of and applicable to all strategies available to investors.

The value of your investments can go down as well as up, and you may not get back the amount you have invested. Investments denominated in a foreign currency will fluctuate with the value of the currency. Certain investments carry additional risks that should be considered before choosing an investment manager or making an investment decision.

CAPITAL MARKET ASSUMPTIONS
BASIS OF MERCER'S ECONOMIC ASSUMPTIONS

- Mercer's capital market assumptions are intended to represent reasonable expectations for the next 10 to 20 years and incorporate a wide range of considerations including:
  - Historical return, risk and correlation statistics of broad indices
  - Estimation of expected future bond yields and returns, based on:
    - Convergence to the equilibrium yield curve (EYC), with
    - 10-year maturity of the EYC set to 90% of assumed long-term nominal GDP growth
    - Remainder of the EYC established using long-term average term premia for other maturities
  - Estimation of component returns to develop total equity returns, using as starting points such items as
    - Current level of equity earnings yield
    - Inflation expectations
    - Expected economic growth
  - Expected relative relationships between asset classes
  - Some forward-looking judgment
- In general, we assume that future returns will be consistent with assumed risk levels

© MERCER 2017

CAPITAL MARKET ASSUMPTIONS
BASIS OF MERCER'S ECONOMIC ASSUMPTIONS

- Note that:
  - All foreign asset class return, risk and correlation assumptions are based on unhedged foreign currency exposures
  - Publicly traded asset class returns are assumed to be index returns
  - Alternative asset class returns are assumed to be inclusive of median alpha (i.e., active management value-added) and net of median fees

© MERCER 2017

CAPITAL MARKET ASSUMPTIONS
SUMMARY OF MERCER'S VIEWS

Mercer's capital market assumptions are intended to represent reasonable long-term expectations given current market conditions

Assumptions are what we believe to be the median of the distribution of possible future long-term returns

Perceived mispricing in current financial market conditions should generally not be incorporated into long-term strategic allocation frameworks

Market inefficiencies should be exploited through the skill of specialist investment managers on a short-term basis and asset allocation tilts on a medium-term basis

In general, we assume that future returns will be consistent with assumed risk levels: riskier asset classes should be expected to provided higher returns

RATE STABILIZATION RESERVE

RSR.1 INTRODUCTION

This chapter explains the following:

- Manitoba Public Insurance's (MPI or the Corporation) application for the minimum (lower) and maximum (upper) Rate Stabilization Reserve (RSR) targets.
- The purpose of the RSR
- MPI's position on certain matters related to the RSR
- The methodology for the calculation of an appropriate RSR range, applied for in this Application

RSR.2 APPLICATION

1. A minimum (lower) RSR target of 34% Minimum Capital Test (MCT), equivalent to a forecasted Total Equity balance of $143 million as at February 28, 2019, based on a 1-in-40 probability Dynamic Capital Adequacy Test (DCAT) scenario.

2. A maximum (upper) RSR target of 85% MCT, equivalent to a forecasted Total Equity balance of $305 million as at February 28, 2019, based on a 2 year, 1-in-40 DCAT scenario with no management action.

RSR.3 PURPOSE OF THE RSR

The purpose of the RSR is:

> *To protect motorists from rate increases that would otherwise have been necessary due to unexpected variances from forecasted results and due to events and losses arising from non-recurring events or factors*

This definition is consistent with the 2018 General Rate Application (GRA) filing.

RSR.4 MPI'S POSITION ON CERTAIN MATTERS RELATED TO THE RSR

Since 2010, MPI and the Manitoba Public Utilities Board (PUB) have been working collaboratively on the Dynamic Capital Adequacy Test (DCAT) as a means to determine appropriate RSR targets. MPI has been very open to PUB feedback on the DCAT and has responded to PUB orders and recommendations on many topics including: (i) utilizing a 1-in-40 risk tolerance, (ii) adjusting the assumptions of adverse scenarios (e.g. inflation, equity returns), (iii) using the PUB's iterative methodology, and (iv) building, modifying, and sharing the Corporation's stochastic and financial models. Based on the 2018 PUB Order, MPI is optimistic that both parties are close to reaching a consensus on a permanent and stable RSR methodology. From MPI's perspective, there remains a few unresolved issues on the RSR methodology. These issue are as follows:

The Lower RSR Target must be greater or equal to the minimum capital required to achieve satisfactory financial condition. MPI cannot support any methodology that produces an RSR target that is lower than the amount required for satisfactory future financial condition. The methodology ordered by PUB in the 2018 GRA produces a 2019 lower RSR target of $120 million, which is below the amount of $143 million required for satisfactory financial condition. For this reason, the Corporation will not be using the 2018 PUB Order methodology. MPI is applying for a lower RSR target of $143 million based on the minimum amount for satisfactory future financial condition.

Any RSR target methodology must be based on best estimates. MPI puts forward a best estimate forecast in each rate application. In the 2018 Order, the PUB ordered a RSR methodology that it acknowledged was not a best estimate. Further, the PUB ordered a 50/50 interest rate forecasting methodology which the Corporation cannot demonstrate to be a best estimate (based on the evidence observed to date). The Corporation cannot support any RSR methodology that is based on biased forecasting assumptions. As a result, the Corporation has not used this methodology;

and instead is opting to apply for a lower and upper RSR target based on the DCAT modeling using best estimate assumptions.

The RSR range calculation must reflect an appropriate time horizon for which the Corporation can respond to adverse financial events. In the 2018 GRA, the Corporation proposed a time horizon of three years for the modeling of the appropriate RSR range above the minimum RSR. In their 2018 Order, the PUB directed MPI to use a two year time horizon. Although the Corporation would prefer a three year time horizon (equivalent to the length of a full PUB ratemaking cycle), the Corporation agrees that a two year time period should be a viable amount of time to respond to adverse events. The Corporation has calculated the RSR range based on a two year time horizon per the PUB directive.

The lower and upper RSR targets are calculated before the inclusion of capital maintenance or capital build/release provisions. To ensure the consistency and stability of the RSR range calculation, MPI has calculated the lower and upper RSR targets based on modeling *before* the inclusion of the proposed capital maintenance provision (CMP). The CMP, along with potential capital build/release provisions in future years, are intended to maintain or adjust capital *within* the calculated range. Including the capital adjustments in the RSR calculation would distort the calculation of the RSR targets and reduce their consistency and stability.

In order for the RSR to be effective, and reduce the incidence of RSR rebuilding fees, the total equity balance of the RSR cannot be at or about the minimum RSR target for a material period of time. Accordingly, MPI is developing a proposal for a Capital Build and Release provision to complement the Net CMP applied for in this Application. MPI anticipates applying for a Capital Build and Release provision/methodology in the 2020 GRA, pending the anticipated approval of the Net CMP and the development of the Corporation's Capital Management Plan.

RSR.4.1 Financial Condition of Basic Insurance

Including plausible management and regulatory action, there are no adverse scenarios at the selected 1-in-40 year probability level that cause Basic Total Equity to fall below

zero during the four-year forecast period. Under the base scenario, the Basic MCT ratio remains above the assumed minimum regulatory capital target of 34% MCT (and the minimum regulatory capital target of 27% MCT based on the 2018 GRA PUB methodology) throughout the forecast period. Based on these finding, the future financial condition of Basic is satisfactory.

RSR.4.2 Transfer to the Basic RSR

MPI's Board of Directors directed that $37.3 million be transferred from the Extension line of business to the Basic RSR as at February 28, 2018. This transfer was made to ensure that Basic Total Equity was above the amount required for Basic to be in satisfactory financial condition ($201 million) as per the 2017 DCAT report.

Although only a $27.5 million transfer was required to achieve an RSR balance of $201 million, the Board decided to transfer $37.3 million so the RSR balance would not be at the absolute minimum amount required for satisfactory financial condition. This is the fourth consecutive year in which the Board of Directors have directed a transfer to Basic RSR in order for Basic to meet a satisfactory financial condition. Between 2013/14 and 2016/17 the Basic line of business suffered net income losses totaling $250 million.

The total amount transferred these past four years is $214 million, which is significantly larger than the $143 million lower RSR target applied for in this application.

RSR.4.3 Board Order 130/17

The PUB decision on the 2018 GRA is Order 130/17. In preparing the 2019 GRA, MPI considered the applicability of the Order 130/17 to the current application. For the purposes of determining the range of the RSR, MPI determined there were three directives that were not appropriate for use in the 2019 Application. The directives and reasons for not following are specified below:

11.19. The 50/50 interest rate forecast shall be used for rate-setting and target capital purposes.

Reason not adopted: The approach is not a best estimate forecast. Historical evidence does not support this as an accurate indicator of interest rate forecast. MPI's external appointed actuary has advised that the naïve forecast is the most commonly used approach in the DCAT reports that they have reviewed.

11.20. For fiscal year 2017/18, the lower threshold for the Basic Total Equity will be $180 million, based on the iterative modelling approach over a two-year time horizon at a 1-in-40 year (97.5th percentile) outcome level after routine management / regulatory actions.

Reason not adopted: (i) the application of the methodology produces a RSR target below the amount required for satisfactory future financial condition, (ii) it is not based on best estimate forecasting assumptions.

11.21. For fiscal year 2017/18, the upper threshold for Basic Total Equity will be $325 million, based on the iterative modelling of a 1-in-40 scenario over a two-year time horizon after routine management / regulatory actions.

Reason for partial adoption: The methodology is not based on best estimate forecasting assumptions; however, MPI is willing to use the two-year time horizon as it should be a viable amount of time to respond to adverse events.

RSR.4.4 RSR Targets Applying the 2018 GRA PUB Methodology

Basic Total Equity, net of any special appropriations, is referred to as the RSR. The PUB capital targets and the capital target methodology can change at any time by a PUB Order.

As described in DCAT.1.4 and RSR.4.5.1.3, application of the PUB methodology from the 2018 Order would require MPI to set the *lower RSR target* using:

(i) A DCAT-based iterative modelling approach

(ii) Over a two-year time horizon

(iii) At a 1-in-40 year (97.5th percentile) outcome level

(iv) Using a 50/50 interest rate forecast, and

(v) After routine management / regulatory actions.

This methodology produces a lower RSR target of $120 million (27% MCT) for the 2019/20 year. For reasons outlined above, MPI has not adopted this methodology. The methodology applied for by MPI (described below in *RSR.4.5.1.2*) produces a lower RSR target of $143 million (34% MCT) for the 2019/20 year. MPI has also proposed that this lower RSR target be converted to an MCT ratio of 34% rather than a dollar amount.

For the *upper RSR target*, applying the methodology from the 2018 Order would require using:

(i) A DCAT-based iterative modeling approach

(ii) over a two-year time horizon

(iii) at a 1-in-40 year (97.5th percentile) outcome level

(iv) Using a 50/50 interest rate forecast

(v) after routine management / regulatory actions

This methodology produces an upper RSR target of $251 million (69% MCT) for the 2019/20 year. For reasons outlined above, MPI has not adopted this methodology. The methodology applied for by MPI (described below in *RSR.4.5.1.3*) produces an upper RSR target of $305 million (85% MCT) for the 2019/20 year. MPI has also proposed that this upper RSR target be converted to an MCT ratio of 85% rather than a dollar amount.

RSR.4.5 RSR Methodology

This section describes the methodologies used to calculate the minimum (lower) and maximum (upper) RSR Targets.

RSR.4.5.1 Dynamic Capital Adequacy Test (DCAT)

The DCAT is used to determine the minimum RSR target. The DCAT is a test that involves customization specific to a particular insurer's risks. The purpose of the DCAT is to identify plausible threats to satisfactory financial condition, actions that would lessen the likelihood of those threats, and actions that would mitigate a threat if it materialized.

The lower RSR target of $143 million is calculated to reflect the minimum Total Equity balance as of the beginning of the 2019/20 fiscal year such that all 1-in-40 year adverse scenarios maintain a positive Total Equity balance over the forecast period. This calculated minimum Total Equity balance is then converted to a Minimum Capital Test ratio of 34% for the purposes of establishing a dynamic RSR target. The selected 1-in-40 year risk tolerance is supported by MPI and the PUB based on Board Order 128/15. The DCAT analysis includes assumed management and regulatory response to any adverse scenarios that are tested. This calculation has been exhaustively tested in past hearings and throughout several (and on-going) collaborative processes.

RSR.4.5.1.1 DCAT Modified Base Scenario and Treatment of Capital Maintenance Provision (CMP)

The base scenario represents a realistic set of assumptions that are used to forecast the insurer's financial position over the forecast period. The modified base scenario used in this DCAT analysis is the same base scenario that the Corporation filed on June 15, 2018 in 2018/19 General Rate Application *with the exception of* the assumed CMP. The Corporation has proposed a CMP in their 2019 GRA. However, the methodology and the proposed amount of this provision (+2.1%) have not yet been approved by the PUB. For the purposes of the DCAT analysis, MPI has assessed the satisfactory financial condition of Basic insurance *excluding* the CMP.

If the CMP is included in the base forecast this increases Basic net income (all else equal) and improves the projected financial position of Basic. As a result, if Basic has satisfactory financial condition *without* a CMP, then it should also have satisfactory future financial condition with a CMP in the forecast. However, the inclusion of the CMP would also change the assumed management and regulatory actions that occur in response to adverse scenarios. As described in *Part VI DCAT.5.2 Management and Regulatory Action*, the DCAT modeling assumption is that the maximum RSR rebuilding fee in response to an adverse event is 2.0% per year; however, this assumption would likely be eliminated (or reduced significantly) if the CMP was included in the base forecast.

The Corporation is also in the process of developing a Capital Management Plan, which *may* result in Capital Build and Release adjustments to the assumed base forecast in future year. Until this plan is put forward by the Corporation and approved by the PUB, MPI believes it is appropriate to exclude any assumed capital adjustments in the best estimate DCAT base forecast.

Lastly, it is MPI's position that including the CMP in the calculation of the PUB's lower and upper RSR targets is not appropriate. The determination of the appropriate RSR targets needs to occur *before* making the decision on how to maintain, build, or release capital within those target. The inclusion of the CMP, or a future capital build and release provision, should not impact the calculation of the actual RSR targets. The

CMP is designed to maintain capital at the existing MCT ratio in the rating year, preferably at a level that is within the lower and upper regulatory capital targets.

The exclusion of any proposed capital adjustments in the calculation of the required RSR targets will also result in more consistent year-to-year assessments of the capital targets. For example, if the Corporation is significantly undercapitalized, it would not be appropriate for an assumed capital maintenance and/or capital build proposal to reduce the calculated lower and upper RSR targets. Nor would it be appropriate to assume that Basic needs more capital when the forecast includes a planned capital release provision.

For the reasons stated above, the base scenario used in the DCAT analysis does not include the CMP. If the Corporation obtains more certainty on its Capital Management Plan in the 2020 GRA, then the specifics of the DCAT analysis can be revised accordingly. The modified base scenario used in this DCAT report assumes a 0.1% break-even rate increase in 2019/20, which is based on the PUB-approved rate setting methodology and the existing break-even mandate for Basic.

As shown in the table below, the Basic MCT Ratio is expected to deteriorate over the forecast period from 69.49% to 42.50% under the modified base scenario (i.e. in the absence of the CMP). Although the absolute amount of capital (Total Equity) does not deteriorate significantly over this time period, the amount of capital required relative to the size and risk level of the business is declining.

Figure RSR- 1: Base Scenario: Includes proposed 0.1% rate increase in 2019/20

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	Net Income	$136	($4)	($5)	($22)	($35)
3	Retained Earnings	$254	$258	$262	$250	$226
4	AOCI[1]	($52)	($44)	($35)	($25)	($15)
5	Total Equity[2]	$254	$258	$262	$250	$226
6	MCT Ratio[3]	69.49%	63.51%	58.30%	51.72%	42.50%

1. Accumulated Other Comprehensive Income
2. Total Equity = Retained Earnings + AOCI
3. Minimum Capital Test Ratio based on the 2017 MCT Guideline

RSR.4.5.1.2 DCAT Results

The tables below summarize the most adverse scenarios tested in the DCAT analysis before applying assumed management and regulatory action for each of the four main risk categories.

Figure RSR- 2: Adverse Scenarios before applying Management Action: Total Equity

Line No.	Adverse Scenarios	2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	Combined Scenario	$254	$187	$150	$103	($36)
3	High Loss Ratio	$254	$194	$137	$66	$4
4	Interest Rate Decline	$254	$243	$211	$170	$116
5	Equity Decline	$254	$242	$234	$206	$165

Figure RSR- 3: Adverse Scenarios before applying Management Action: Minimum Capital Test Ratio

Line No.	Adverse Scenarios	2018/19	2019/20	2020/21	2021/22	2022/23
1	Combined Scenario	69.49%	41.27%	25.33%	11.10%	-25.54%
2	High Loss Ratio	69.49%	44.06%	22.50%	1.29%	-15.76%
3	Interest Rate Decline	69.49%	56.98%	41.32%	28.94%	13.68%
4	Equity Decline	69.49%	58.20%	50.46%	40.23%	27.25%

Based on the above results, the most adverse scenario before management action was the four-year Combined Scenario. The actuary must also determine the most adverse scenario at each return period (1, 2, 3, and 4 years) because assumed management action *may* result in a change to the most adverse scenario. In all cases the Combined Scenario was the most adverse scenario before assumed management action. The table below shows the results of the Combined Scenario for each return period before and after assumed management action.

Figure RSR- 4: Combined Scenario: Basic Total Equity before Management Action

Line No.	Combined Scenarios	2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	1 year	$254	$147			
3	2 year	$254	$207	$100		
4	3 year	$254	$197	$111	$39	
5	4 year	$254	$187	$150	$103	($36)

Figure RSR- 5: Combined Scenario: Basic Total Equity after Management Action

Line No.	Combined Scenarios	2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	1 year	$254	$147			
3	2 year	$254	$207	$122		
4	3 year	$254	$197	$133	$130	
5	4 year	$254	$187	$172	$206	$208

As shown in the table above, MPI Basic maintains a positive Total Equity balance for all 1-in-40 year adverse scenarios tested in the DCAT analysis.

RSR.4.5.1.3 Minimum (Lower) RSR Target

As part of the DCAT collaboration with the PUB, this DCAT report also provides the minimum Total Equity balance as at the beginning of the 2019/20 fiscal year such that all 1-in-40 year adverse scenarios after management action will maintain a Total Equity balance above zero over each return period. As shown in the table below, the minimum Total Equity balance required, such that all of Combined Scenarios after assumed management action remain above zero, is $143 million. MPI then converted the $143 million to an MCT ratio of 34% for the proposed lower RSR target.

Figure RSR- 6: Minimum Total Equity Balance as of the end of Fiscal 2018/19. Combined Scenario Basic Total Equity after Management Action

Line No.	Combined Scenarios	2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	1 year	$103	$0			
3	2 year	$143	$90	$0		
4	3 year	$140	$78	$9	$0	
5	4 year	$100	$24	$0	$25	$20

RSR.4.5.1.4 Maximum (Upper) RSR Target

As part of the DCAT collaboration with the PUB, the DCAT report also provides a recommended maximum capital target as at the beginning of the 2019/20 fiscal year such that Basic has an appropriate operating range for the RSR above the minimum capital target. The tables below show the DCAT modeling output at selected time horizons and probability levels before management action. The Corporation has proposed a maximum RSR target based on a two-year, 1-in-40, DCAT scenario before management action resulting in a maximum RSR target of $305 million (i.e. $162 million above the lower RSR target of $143 million). MPI then converted the $305 million to an MCT ratio of 85% for the proposed upper RSR target. See *DCAT.6* for more information.

Figure RSR- 7: Dollar Deviations from Best Estimate Forecast by Forecast Period and Percentile

Line No.		Forecast Period (Years)	
	Percentile	2	3

1	*(in millions)*		
2	2.5th	$305	$354
3	5th	$279	$318

RSR.4.5.1.5 DCAT Peer Review

The external peer review of the 2017 DCAT Report by Joe S. Cheng F.C.I.A. is filed as *DCAT Attachment A*. Due to the timing of the DCAT process for the 2018 GRA, the external review was not released until October 17, 2017. There were no material changes required to the 2018 DCAT report as a result of the external review.

RSR.4.5.2 Minimum Capital Testing (MCT)

RSR.4.5.2.1 MCT is an Evidence Based Approach to Capital Adequacy accepted by Canadian Regulators

The MCT is a standardized test that is used by the Property and Casualty insurance industry and its regulators. The MCT was developed to assess the key risks faced by the industry and to harmonize capital requirements across jurisdictions in Canada. It is a risk-based approach that reflects the riskiness of individual Property and Casualty insurers and is consistent with approaches in other financial sectors. It assesses the riskiness of assets, policy liabilities, and off-balance sheet exposures, by applying various factors.

The MCT provides objective information about the risk level of the Basic program and how that risk level compares to other automobile insurers (both public and private). Using MCT in this manner provides a comparator of the RSR relative to the risk levels established for other regulated insurers.

The MCT is used by federally regulated insurers in Canada to determine their minimum capital requirements. The test is also used by the regulatory bodies in Saskatchewan and British Columbia to determine the minimum capital requirements for Saskatchewan Government Insurance (SGI) and the Insurance Corporation of British Columbia (ICBC).

Federally regulated insurers must maintain a minimum MCT ratio above 100% and a minimum supervisory MCT ratio of 150%. The supervisory ratio is intended to provide a cushion above the minimum requirement for risk factors that are not easily quantifiable (e.g. operational, strategic, economic risks). Most insurers maintain an actual MCT ratio in excess of 200%, with the overall industry of OSFI accountable insurers having a consolidated MCT of 219% as at December 31, 2017.

SGI targets an MCT score of 100% for its Auto Fund program, while ICBC targets a minimum 100% MCT for its Basic program.

RSR.4.5.2.2 MCT Measures Risks that are faced by MPI

MPI holds a monopoly position over compulsory insurance in Manitoba; however the risks being measured by the MCT are also applicable to MPI. The MCT guideline outlines the five risk categories that underpin the MCT:

1. Insurance Risk
2. Market Risk
3. Credit Risk
4. Operational Risk
5. (Less) Diversification Credit

The MCT Guideline explains these risks and their measurement in detail, which are summarized below.

The Office of the Superintendent of Financial Institutions (OSFI) defines[1] "insurance risk" as the risk arising from the potential for claims or payouts to be made to policyholders. Uncertainties exist around the ultimate amount of net cash flows, and the timing of these cash flows.

OSFI defines[2] "market risk" as the risk that arises from changing rates or prices in various markets such as interest rates, foreign exchange and real estate. Trading, investing and related business activities create exposure to these risks.

OSFI defines[3] "credit risk" as the risk of loss arising from counterparty's inability or unwillingness to fully meet a contractual obligation owed to an insurer. OSFI describes this risk materializing any time funds are extended through contractual agreements.

OSFI defines[4] "operational risk" as the risk of loss resulting from inadequate or failed internal processes, people, and system, or from external events. An insurer is exposed to operational risk through day-to-day operations, or specific external events.

Finally, OSFI defines[5] a diversification credit to account for the fact that not all risks are perfectly correlated, and that an insurer is unlikely to incur the maximum possible loss from each risk type simultaneously.

MPI's status as a Crown Corporation and its monopoly over the compulsory insurance do not mitigate these risks. This fact is underscored by two points:

1. MPI can, and does, measure these risks, in accordance with the OSFI guidelines. These calculations are presented in *RSR Appendix 1*

[1] MCT Guidelines 2016, p.29 (http://www.osfi-bsif.gc.ca/Eng/fi-if/rg-ro/gdn-ort/gl-ld/Pages/mct2016-let.aspx)
[2] MCT Guidelines 2016, p.46
[3] MCT Guidelines 2016, p.60
[4] MCT Guidelines 2016, p.75
[5] MCT Guidelines 2016, p.79

2. Other monopoly crown insurers, namely ICBC and SGI, employ the MCT as the appropriate test of Capital Adequacy.

RSR.4.5.3 2017 MCT Guideline

MPI has utilized the latest available and complete MCT Guideline (i.e. the 2017 MCT Guideline) in the calculation of both the actual MCT results for 2017/18 and the modeled MCT results over the 2018/19 to 2022/23 forecast period. There were no revisions from the 2016 MCT Guideline that would materially impact the financial results of MPI's actual or modeled financial results. As such, a reconciliation between the 2017 and 2016 Guidelines has not been provided. In addition, while OSFI has not yet released a final 2018 Guideline, they have indicated that there are currently no significant draft revisions for 2018.

RSR.4.5.3.1 2017/18 MCT Calculation

As of February 28, 2018, MPI's actual MCT ratio was 44%. The updated MCT calculation can be found in *RSR Appendix 1*.

The 2017/18 MCT calculation indicates that there is $156 million in Capital Available for Basic, despite Basic having a Total Equity balance of $211 million at year end 2017/18. The difference between Total Equity and Capital Available is a result of the MCT calculation requirement that certain assets (namely deferred development and receivables from unregistered insurers) are to be deducted from Total Equity in the establishment of Capital Available.

Figure RSR- 9: Actual MCT Ratio % for February 28, 2018

Line No.		2017/18
1	***(in millions)***	
2	Minimum Capital Required	$352
3	Actual Total Equity	$211
4	Less: Assets requiring 100% Capital	$55
5	Capital Available	$156
6	**Actual MCT Ratio %** (Line 5) / (Line 2)	**44%**

RSR.4.5.4 Forecasted MCT Ratio

The table below shows the MCT calculations at each year fiscal year end over the forecast period

Figure RSR- 10: Forecast MCT Ratio % for the Base Forecast

Line No.		Fiscal Year ending February 28, 20XX			
		2019	2020	2021	2022
1	***(in millions)***

RSR.4.6 Impact of the Asset and Liability Management (ALM) Study on the DCAT and MCT Results

As described in *Part VI INV.2.1 ALM Study*, the DCAT modeling and the MCT results for 2019/20 and thereafter reflect the assumed implementation of the Corporation's new Asset and Liability Management (ALM) program. The ALM strategy results in a significant decrease in net interest rate risk and investment risk for Basic insurance. As a result, the indicated Total Equity requirement for the DCAT and the Total Equity requirement to achieve a 100% MCT ratio have also decreased to reflect this new risk level. The table below shows how the indicated DCAT-based lower and upper RSR

targets (using the Corporation's proposed methodology) and the 100% MCT Total Equity amount have changed as a result of the ALM strategy.

Figure RSR- 11: Lower / Upper Target Comparison

Line No.	Target	2018 GRA Total Equity	2018 GRA MCT Ratio	2019 GRA Total Equity	2019 GRA MCT Ratio
	(C$millions, unless otherwise noted)				
1	Lower RSR Target (MPI)	$201	37%	$143	34%
2	Upper RSR Target (MPI)	$438	100%	$305*	85%*
3	Lower RSR Target (PUB)	$180	31%	$120	27%
4	Upper RSR Target (PUB)	$325	72%	$251	69%
5	100% MCT	$438	100%	$358	100%

* Would have been $354M and 99% MCT without methodology change

As shown in the above table, the indicated DCAT targets in dollar terms have declined to reflect the new risk level for Basic; however, the MCT ratios have only experienced minor changes. These results demonstrate that the risk measurement in the DCAT analysis is very consistent with that of the MCT test. The capital requirements to achieve a 100% MCT ratio reflect risk levels in excess of 1-in-100, while MPI's DCAT is based on a 1-in-40 risk level.

Given the alignment between the DCAT results and the MCT ratios, the most straightforward method for explaining the risk reduction from the change brought about under the new ALM program is by comparing last year's 100% MCT capital requirement to this year's 100% MCT capital requirement. The capital required for 100% MCT declined by $80 million (-18.3%) relative to last year's 100% MCT amount. The reduction can be summarized as follows:

- Growth in the business: $32 million increase
- Lower Assets Requiring 100% Capital: $25 million decrease
- Change in ALM strategy: $87 million decrease:
    - Greater percentage of fixed income assets: $7 million increase
    - Lower % of Equity and Real Estate assets: $87 million decrease
    - Lower operational risk: $7 million decrease

DYNAMIC CAPITAL ADEQUACY TESTING

DCAT.1 SUMMARY OF FINDINGS

I have completed the annual investigation of the future financial condition of Basic Compulsory Autopac Insurance (Basic) as at February 28, 2018 in accordance with accepted actuarial practice in Canada. I have analyzed the forecasted financial positions of the company during the five year forecast period under a series of scenarios. A description of these scenarios and their impact on the company is included within this report.

The most significant assumptions are described within this report. The investigation incorporates assumptions relating to business growth, investments, claims frequency and severity, transfer of capital between lines of business, and other internal and external conditions during the forecast period. My report includes the identification of key risk exposures and the corrective management and regulatory actions that could be taken to mitigate the effect of plausible adverse scenarios.

In my opinion, the future financial condition of Basic is satisfactory because (i) Basic exceeds the Manitoba Public Utility Board's (PUB) assumed minimum capital target under the base scenario during the forecast period and (ii) Basic Total Equity remains positive in all adverse scenarios at the 1-in-40 probability level as set by the Public Utilities Board.

In my assessment of the reasonableness of the base scenario, I have noted that the forecast assumes a significant change in the overall risk level of Basic in the 2019/20 fiscal year as a result of the assumed implementation of Manitoba Public Insurance's (MPI or the Corporation) new Asset and Liability Management (ALM) program. Although I consider these assumption to be reasonable, the base forecast is highly sensitive to the successful implementation of the program. However, given the current and projected Total Equity balance for MPI, my opinion is that the future financial

condition of Basic will remain satisfactory even if there are moderate delays or minor changes to the assumed implementation of the program.

Winnipeg, Manitoba
June 10, 2018

Luke Johnston
Fellow, Canadian Institute of Actuaries

DCAT.1.1 Satisfactory Expected Future Financial Condition

The insurer's financial condition would be satisfactory if throughout the forecast period:

- Under the base scenario, the insurer meets the PUB's assumed minimum Rate Stabilization Reserve (RSR) target (as described in Section 3 of this report).
- Under the base scenario and all plausible adverse scenarios, the statement value of the insurer's assets is greater than the statement value of its liabilities.

DCAT.1.2 Modified Base Scenario

The base scenario represents a realistic set of assumptions that are used to forecast the insurer's financial position over the forecast period. The modified base scenario used in this Dynamic Capital Adequacy Testing (DCAT) analysis is the same base scenario that the Corporation filed on June 15, 2018 in the 2018/19 General Rate Application (GRA) *with the exception of* the assumed Capital Maintenance Provision (CMP). The Corporation has proposed a CMP in their 2019 GRA. However, the methodology and the proposed amount of this provision (+2.1%) have not yet been approved by the Public Utilities Board. For the purposes of the DCAT analysis, the Corporation has assessed the satisfactory financial condition of Basic insurance *excluding* the CMP.

If the CMP is included in the base forecast this increases Basic net income (all else being equal) and improves the projected financial position of Basic. As a result, if Basic has satisfactory financial condition *without* a CMP, then it should also have satisfactory future financial condition with a CMP in the forecast. However, the inclusion of the CMP provision would also change the assumed management and regulatory actions that occur in response to adverse scenarios. As described in *DCAT.5.2 Management and Regulatory Action*, we have assumed that the maximum Rate Stabilization Reserve rebuilding fee in response to an adverse event is 2.0% per

year, but this assumption would likely be eliminated (or reduced) if the CMP was included in the base forecast.

The Corporation is also in the process of developing a Capital Management Plan, which *may* result in Capital Build and Release adjustments to the assumed base forecast. Until this plan is put forward by the Corporation and approved by the PUB, MPI believes it is appropriate to exclude any assumed capital adjustments in the best estimate DCAT base forecast.

Lastly, it is the Corporation's position that including the Capital Maintenance Provision in the calculation of the PUB's lower and upper RSR targets is not appropriate. The determination of the appropriate RSR targets needs to occur *before* making the decision on how to maintain, build, or release capital within those target. The inclusion of the CMP, or a future capital build and release provision, should not impact the calculation of the RSR targets themselves. The CMP is designed to maintain capital at the existing Minimum Capital Test (MCT) ratio in the rating year, preferably at a level that is within the lower and upper regulatory capital targets.

The exclusion of any proposed capital adjustments in the calculation of the required RSR targets will also result in more consistent year-to-year assessments of the capital targets. For example, if the Corporation is significantly undercapitalized, it would not be appropriate for an assumed capital maintenance and/or capital build proposal to reduce the calculated lower and upper RSR targets. Nor would it be appropriate to assume that Basic needs more capital when the forecast includes a planned capital release provision.

For the reasons stated above, the base scenario used in the DCAT analysis does not include the Capital Maintenance Provision. If the Corporation obtains more certainty on its Capital Management Plan in the 2020 GRA, then the specifics of the DCAT analysis can be revised accordingly. The modified base scenario used in this DCAT report assumes a 0.1% break-even rate increase in 2019/20, which is based on the PUB-approved rate setting methodology and the existing break-even mandate for Basic.

Modified Base Scenario – Financial Forecast

As shown in the table below, the Basic MCT Ratio is expected to deteriorate over the forecast period from 69.49% to 42.50% under the modified base scenario (i.e. in the absence of the CMP). Although the absolute amount of capital (Total Equity) does not deteriorate significantly over this time period, the amount of capital required relative to the size and risk level of the business is declining. The estimated minimum capital requirement from the PUB is 27% MCT (see *DCAT.3.1*).

Figure DCAT- 1: Base Scenario: Includes proposed 0.1% rate increase in 2019/20

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*

7 1. Accumulated Other Comprehensive Income
8 2. Total Equity = Retained Earnings + AOCI
9 3. Minimum Capital Test Ratio based on the 2017 MCT Guideline

DCAT.1.3 Adverse Scenarios

An adverse scenario is a scenario with an adverse outcome developed by stress testing the assumptions used in the base scenario with regards to risk factors that may trigger potential threats to the insurer's financial condition. An adverse scenario would be characterized as a plausible adverse scenario if it is credible and has a non-trivial probability of occurring. In this DCAT report, the selected adverse scenarios are at the 1-in-40 year probability level.

Actuarial standards of practice require the actuary to test and report on a minimum of three plausible adverse scenarios posing the greatest threat to the insurer. In addition, the actuary must also report on all adverse scenarios that would cause MPI

Basic to fall below the PUB's target capital requirement (see section *Part VI Rate Stabilization Reserve RSR.3*).

The table below summarizes the most adverse scenarios tested in this report before applying assumed management and regulatory action for each of the four main risk categories.

Figure DCAT- 2: Adverse Scenarios before applying Management Action: Total Equity

Line No.	Adverse Scenarios	2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	Combined Scenario	$254	$187	$150	$103	($36)
3	High Loss Ratio	$254	$194	$137	$66	$4
4	Interest Rate Decline	$254	$243	$211	$170	$116
5	Equity Decline	$254	$242	$234	$206	$165

Figure DCAT- 3: Adverse Scenarios before applying Management Action: Minimum Capital Test Ratio

Line No.	Adverse Scenarios	2018/19	2019/20	2020/21	2021/22	2022/23
1	Combined Scenario	69.49%	41.27%	25.33%	11.10%	-25.54%
2	High Loss Ratio	69.49%	44.06%	22.50%	1.29%	-15.76%
3	Interest Rate Decline	69.49%	56.98%	41.32%	28.94%	13.68%
4	Equity Decline	69.49%	58.20%	50.46%	40.23%	27.25%

Based on the above results, the most adverse scenario before management action was the four-year Combined Scenario. The actuary must also determine the most adverse scenario at each return period (1, 2, 3, and 4 years) because assumed management action may result in a change to the most adverse scenario. In all cases the Combined Scenario was the most adverse scenario before assumed management action. The table below shows the results of the Combined Scenario for each return period before and after assumed management action.

Figure DCAT- 4: Combined Scenario: Basic Total Equity before Management Action

Line No.	Combined Scenarios	2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	1 year	$254	$147			
3	2 year	$254	$207	$100		
4	3 year	$254	$197	$111	$39	
5	4 year	$254	$187	$150	$103	($36)

Figure DCAT- 5: Combined Scenario: Basic Total Equity after Management Action

Line No.	Combined Scenarios	2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	1 year	$254	$147			
3	2 year	$254	$207	$122		
4	3 year	$254	$197	$133	$130	
5	4 year	$254	$187	$172	$206	$208

As shown in the table above, MPI Basic maintains a positive Total Equity balance for all 1-in-40 year adverse scenarios tested in this report.

DCAT.1.4 Minimum Capital Required for Satisfactory Financial Condition (Minimum Rate Stabilization Reserve)

As part of the DCAT collaboration with the PUB, this report also provides the minimum Total Equity (i.e. Rate Stabilization Reserve) balance as at the beginning of the 2019/20 fiscal year such that all 1-in-40 year adverse scenarios after management action will maintain a Total Equity balance above zero over each return period. As shown in the table below, the minimum Total Equity balance such that all of Combined Scenarios after assumed management action remain above zero is $143 million.

Figure DCAT- 6: Minimum Total Equity Balance as of the end of Fiscal 2018/19. Combined Scenario Basic Total Equity after Management Action

Line No.	Combined Scenarios	2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	1 year	$103	$0			
3	2 year	$143	$90	$0		
4	3 year	$140	$78	$9	$0	
5	4 year	$100	$24	$0	$25	$20

DCAT.1.5 Maximum Rate Stabilization Reserve Target

As part of the DCAT collaboration with the PUB, this report also provides a recommended maximum capital target as at the beginning of the 2019/20 fiscal year such that Basic has an appropriate operating range for the Rate Stabilization Reserve above the minimum RSR target.

The table below shows the DCAT modeling output at selected time horizons and probability levels that could be considered reasonable for the selection of an RSR range. The modeling results are before management action. The Corporation has proposed that the maximum capital target be selected based on a 2 year, 1-in-40, DCAT scenario before management action, which results in a maximum capital target of $305 million. In my opinion, the calculated RSR range ($143 and $305) is reasonable given the stated purpose of the Rate Stabilization Reserve. See *DCAT.6* for more information.

Figure DCAT- 7: Dollar Deviations from Best Estimate Forecast by Forecast Period and Percentile

Line No.		Forecast Period (Years)	
	Percentile	2	3
1	*(in millions)*		
2	2.5th	($162)	($211)
3	5th	($136)	($176)

Figure DCAT- 8: Implied RSR Range by Forecast Period and Percentile

Line No.	Percentile	Forecast Period (Years) 2	3
1	*(in millions)*		
2	2.5th	$305	$354
3	5th	$279	$318

DCAT.1.6 Rationale for Actuarial Opinion

Including plausible management and regulatory action, there are no adverse scenarios at the selected 1-in-40 year probability level that cause Basic Total Equity to fall below zero during the four-year forecast period. Under the base scenario, Basic maintains a Total Equity balance above the projected minimum regulatory capital target. As a result, the financial condition of Basic is satisfactory.

DCAT.1.7 Review of Events Since the Previous DCAT Report

DCAT.1.7.1 Asset and Liability Management (ALM) Study

The DCAT modeling and the MCT results for 2019/20 and thereafter reflect the assumed implementation of the Corporation's new ALM program. The ALM program results in a significant decrease in net interest rate risk and investment risk for Basic insurance. The table below reflects the target asset allocations before and after the assumed ALM implementation.

Figure DCAT- 9: Pre-ALM and Post-ALM Asset Allocation

Line No.	Asset Class	Post-ALM Allocations: Basic Claims Target Weight	Post-ALM Allocations: RSR Target Weight	Post-ALM Allocations: Basic Line of Business Average Weight*	Pre-ALM (Current) Allocation: Basic Line of Business Target Weight
1	Fixed Income				
2	Provincial Bonds	60.0%	20.0%	50.5%	45.0%
3	Corporate Bonds	20.0%	10.0%	20.2%	5.0%
4	MUSH	20.0%	5.0%	19.9%	20.0%
5	Private Debt	0.0%	15.0%	1.6%	0.0%
6	Total Fixed Income	100.0%	50.0%	92.2%	70.0%
7	Public Equities				
8	Canadian Equities	0.0%	12.0%	1.9%	10.0%
9	U.S. Equities	0.0%	0.0%	0.0%	5.0%
10	Global Equities	0.0%	13.0%	2.0%	0.0%
11	Global Low Volatility	0.0%	10.0%	1.6%	0.0%
12	Total Equities	0.0%	35.0%	5.5%	15.0%
13	Alternatives				
14	Canadian Real Estate	0.0%	10.0%	1.5%	10.0%
15	Infrastructure	0.0%	5.0%	0.8%	5.0%
16	Total Alternatives	0.0%	15.0%	2.3%	15.0%

17 * Based on average asset class weight from 2018/19 to 2022/23 (year-end values)

The indicated Total Equity requirement for the DCAT and the Total Equity required to achieve a 100% MCT ratio have decreased to reflect the new post-ALM risk level. The table below shows how the indicated DCAT-based lower and upper RSR targets (using the Corporation's proposed methodology) and the 100% MCT Total Equity amount have changed as a result of the ALM strategy.

Figure DCAT- 10: Lower/Upper Target Comparison

Line No.	Target	2018 GRA Total Equity	2018 GRA MCT Ratio	2019 GRA Total Equity	2019 GRA MCT Ratio
1	*(C$millions, unless otherwise noted)*				
2	Lower RSR Target (MPI)	$201	37%	$143	34%
3	Upper RSR Target (MPI)	$438	100%	$305*	85%*
4	Lower RSR Target (PUB)	$180	31%	$120	27%
5	Upper RSR Target (PUB)	$325	72%	$251	69%
6	100% MCT	$438	100%	$358	100%

7 * Would have been $354M and 99% MCT without methodology change

As shown in the above table, the indicated DCAT targets in dollar terms have declined to reflect the new risk level for Basic; however, the MCT ratios have only experienced minor changes. These results demonstrate that the risk measurement in the DCAT analysis is proportionally consistent with that of the MCT test. The indicated DCAT MCT-based targets are lower because a 100% MCT ratio reflect risk levels in excess of 1-in-100, while MPI's DCAT is based on a 1-in-40 risk level including management and regulatory actions.

Given the alignment between the DCAT results and the MCT ratios, the most straightforward method for explaining the risk reduction from the change in ALM strategy is by comparing last year's 100% MCT capital requirement to this year's 100% MCT capital requirement. The capital required for 100% MCT declined by $80 million (-18.3%) relative to last year's 100% MCT amount. The reduction can be summarized as follows:

- Growth in the business: $32 million increase
- Assets requiring 100% capital: $25 million decrease
- Change in ALM strategy: $87 million decrease:
    - Greater percentage of fixed income assets: $7 million increase
    - Lower percentage of equity and real estate assets: $87 million decrease
    - Lower operational risk: $7 million decrease

DCAT.1.7.2 Transfer of Capital

The Corporation transferred $37.3 million in capital from its Extension line of business to Basic at the end of the 2017/18 fiscal year. The transfer was made to bring the year end 2017/18 Basic Total Equity balance above the $201 million target proposed by the Corporation in the 2018 Rate Application.

As noted in *Figure DCAT-10*, this is the fourth consecutive year in which the Corporation's Board of Directors has transferred funds from Extension to restore the Rate Stabilization Reserve to at least the minimum requirement for satisfactory financial condition. Without these $214 million in transfers, Basic Total Equity would be close to zero (all else equal).

DCAT.1.7.3 PUB Order 130/17

The PUB decision on the 2018 GRA is Order 130/17. In preparing the 2019 GRA, MPI considered the applicability of the Order 130/17 to the current application. For the purposes of determining the range of the RSR, MPI determined there were three directives that were not appropriate to be used in this application. The directives and reasons for not following are specified below:

> *11.19 The 50/50 interest rate forecast shall be used for rate-setting and target capital purposes.*
> **Reason not adopted: The approach is not a best estimate forecast. Historical evidence does not support this as an accurate indicator of interest rate forecast. MPI's external appointed actuary also advised that the naïve forecast is the commonly used approach in the DCAT reports that they have reviewed.**

> *11.20. For fiscal year 2017/18, the lower threshold for the Basic Total Equity will be $180 million, based on the iterative modelling approach over a two-year time horizon at a 1-in-40 year (97.5th percentile)*

outcome level after routine management / regulatory actions. **Reason not adopted: (i) the application of the methodology produces an RSR target below the amount required for satisfactory future financial condition, (ii) it is not based on best estimate forecasting assumptions.**

11.21. For fiscal year 2017/18, the upper threshold for Basic Total Equity will be $325 million, based on the iterative modelling of a 1-in-40 scenario over a two-year time horizon after routine management / regulatory actions.
Reason for partial adoption: The methodology is not based on best estimate forecasting assumptions; however, MPI is willing to use the two-year time horizon as it should be a viable amount of time to respond to adverse events.

DCAT.1.7.4 2017 DCAT Peer Review

The 2017 DCAT report was peer reviewed by Joe S. Cheng, F.C.I.A. from J.S. Cheng & Partners. In Joe Cheng's report, released October 17, 2017, he had the following major finding and recommendation (MPI's response in **bold**):

- This report introduces a naïve interest rate assumption throughout the forecast period. Previous increasing rate assumptions have proved to be incorrect, compounding forecasting errors. In my opinion, a naïve interest rate assumption is appropriate for the base scenario. Notwithstanding the two recent rate hikes by the Bank of Canada (BoC), I do not see any material risk in assuming a naïve interest rate as a base case. My initial guess is an increase in interest rates should strengthen the financial position of Basic.
  Response: MPI agrees with this assessment.

- The report concludes that Basic's future financial condition is not satisfactory as total equity does not meet the PUB's assumed minimum capital target throughout the forecast period in the base scenario. This is due to a 0% profit

target, no RSR rebuilding fees, and approved rate increases lower than indicated rate increases.

Response: MPI agrees that these reasons, combined with an already low RSR balance at the time of the 2018 GRA filing, are the main contributors to the 'not satisfactory' opinion in the 2017 DCAT report.

- While the strategy to increase asset allocation in corporate bonds makes economic sense, it is not without risk. The assumption will increase MPI's discount rate and decrease claim liabilities by about $80 million in the short run. However, when the International Financial Reporting Standards (IFRS) 17 is implemented in 2021, the discount rate will no longer be tied to the actual portfolio; it will be a risk-free rate plus a liquidity premium. I think this will result in a drop in discount rate and a substantial increase in claim liabilities unless Government of Canada (GoC) bond yields increase significantly between now and 2021.

  Response: MPI agrees with this assessment; however, the Corporation also anticipates that the required interest rate risk margin will fall on the implementation of IFRS 17 as a result of moving to a risk-free rate plus liquidity premium, offsetting some of this impact. MPI continues to monitor the potential transitional impacts of IFRS 17.

DCAT.1.8 Recommendations

1. Set the minimum Total Equity target at $143 million (or 34% MCT) for Basic. This amount represents the amount of Total Equity required at the beginning of the 2019/20 fiscal year such that the base scenario and all adverse scenarios at a 1-in-40 year probability level maintain a positive Total Equity balance over the forecast period.

2. Establish a range above the recommended minimum capital target such that Basic (i) can withstand a reasonable level of variability in its financial results without falling below the minimum capital target; and (ii) would not issue rebates to customers within this range A range would also protect the Basic

program from other risk factors that are not easily quantifiable. The Corporation has proposed an upper capital target of $305 million (or 85% MCT) based on analysis conducted in *DCAT.6* of this report. I believe the proposed upper target is reasonable for this purpose.

3. The Corporation should convert their proposed dollar-based RSR targets into MCT-based RSR targets. MCT-based targets create a dynamic RSR target that responds to changes in risk level and can be more directly compared with other insurers.

4. If the Total Equity balance falls below the recommended minimum target, management should implement a plan to restore Total Equity to above the target.

5. Management should conduct an analysis of the expected impacts from IFRS 17, specifically in terms of the discount rate used in the valuation of policy liabilities. These impacts should be well understood by the October 2018 valuation (if possible).

6. If there is a significant increase in projected claims costs, management should be prepared to increase rates as quickly as possible.

7. Management should continue to monitor loss cost and premium trends to determine if there are any threats to the financial condition of Basic.

8. Management should continue to monitor its reinsurance coverage as the severity of the modeled adverse scenarios could increase substantially if this coverage is reduced.

9. Management should continue to monitor the level of interest rate risk included in the setting of Basic rates and from the net impacts to assets and liabilities caused by changes in interest rates.

10. Management should continue to monitor other important risk factors such as inflation, policy liability risk, and changes to International Financial Reporting Standards (IFRS).

DCAT.2 INTRODUCTION

DCAT.2.1 Role of the Appointed Actuary

As per Subsection 2520 of the Canadian Institute of Actuaries Standards of Practice:

> *The appointed actuary should make an investigation at least once during each financial year of the insurer's recent and current financial position and financial condition, as revealed by dynamic capital adequacy testing for selected scenarios.*
>
> *The appointed actuary should make a report of each investigation in writing to the insurer's board of directors (or to their audit committee if they so delegate) or its chief agent for Canada. The report should identify possible actions for dealing with any threats to satisfactory financial condition that the investigation reveals.*
>
> *The appointed actuary should ensure that the investigation is current. The investigation should take into consideration recent events and recent financial operating results of the insurer.*

DCAT.2.2 Purpose

The purpose of DCAT is to identify (i) plausible threats to satisfactory financial condition, (ii) actions that would lessen the likelihood of those threats, and (iii) actions that would mitigate a threat if it materialized.

DCAT.2.3 Scope

The DCAT report contains the key assumptions of the base scenario and the plausible adverse scenarios posing the greatest risk to the satisfactory financial condition of MPI Basic. This report discloses each of the risk categories considered in undertaking the DCAT analysis, including those identified in the CIA Standards of Practice.

If the investigation identifies any plausible threat to the satisfactory financial condition of MPI Basic, then the actuary would identify corrective management action that would lessen or mitigate that threat if it materialized. For each adverse scenario reported upon, the actuary would report the results both with and without the effect of corrective management action. (See *section 2520.34 of CIA Standards of Practice*).

The DCAT analysis was performed by Luke Johnston, FCIA, FCAS, and Chief Actuary and Vice President, Product and Risk Management. Mr. Johnston is available to answer any questions in regards to this report and can be reached at the following address:

Manitoba Public Insurance
912-234 Donald Street Box 6300
Winnipeg, MB R3C 4A4
Telephone: (204) 985-8770 ext 8050
Email: ljohnston@mpi.mb.ca

DCAT.2.4 Use and Distribution

The DCAT report was prepared for the internal use of MPI. A copy of this report may be provided to the Company's external auditors and to the PUB.

DCAT.2.5 Process

DCAT has the following key elements:

- Development of a base scenario;

- Analysis of the impact of adverse scenarios;
- Identification and analysis of the effectiveness of various strategies to mitigate risks;
- A report on the results of the analysis and recommendations to the insurer's management and the Board of Directors; and
- An opinion signed by the actuary and included in the report on the financial condition of the insurer.

DCAT.2.6 Method

The Corporation's internal financial model was used to perform the 2018 DCAT analysis. Detailed output from the financial model is provided in the supporting Appendices for the base scenario and for each adverse scenario tested in this report.

The Corporation's base scenario was generated through the combined effort of several departments and committees, including:

- Actuarial Services Unit
- Investments Unit
- Financial Forecasting and Reinsurance Unit
- Forecasting Committee
- Executive Committee

The assumptions and forecasts generated by the above units and committees are the inputs for the Corporation's financial model. A written summary of the base scenario assumptions are contained in *DCAT.4* of this report, while detailed model output for the base scenario with 0.1% rate change is contained in *DCAT Appendix 1*.

The modeling of plausible adverse scenarios involves reviewing all of the assumptions (or inputs) of the base scenario and determining how they are impacted by the event. A new set of assumptions and forecasts are then generated based on the assumed plausible adverse scenario. These assumptions are then input into the financial model and the results are compared to the base scenario.

DCAT.2.7 Data Sources

To perform this valuation, I have used information provided by:

- Glenn Bunston, Manager, Investments
- Wes Sprenger, Senior Investment Forecasting Specialist, Investments
- Dean Dunstone, Assistant Manager, Financial Forecasting and Reinsurance
- Tyler Clearwater, Actuarial Analyst, Actuarial Services
- Mark Russo, Accountant 2, Financial Forecasting and Reinsurance

DCAT.3 CAPITAL ADEQUACY MANAGEMENT

DCAT.3.1 Regulatory Capital Requirements

Basic Total Equity, net of any special appropriations, is referred to as the RSR. The PUB capital targets and the capital target methodology can change at any time by a PUB Order.

As described in DCAT.1.4, application of the PUB methodology from the 2018 Order would require MPI to set the *lower RSR target* using:

i. A DCAT-based iterative modelling approach

ii. Over a two-year time horizon

iii. At a 1-in-40 year (97.5th percentile) outcome level

iv. Using a 50/50 interest rate forecast, and

v. After routine management / regulatory actions.

This methodology produces a lower RSR target of $120 million (27% MCT) for the 2019/20 year. For reasons outlined in DCAT.1.7.3, MPI has not adopted this

methodology. The MPI applied for methodology produces a lower RSR target of $143 million (34% MCT) for the 2019/20 year. MPI has also proposed that this lower RSR target be converted to an MCT ratio of 34% rather than a dollar amount.

For the *upper RSR target*, applying the methodology from the 2018 Order would require using:

1. A DCAT-based iterative modeling approach
2. over a two-year time horizon
3. at a 1-in-40 year (97.5th percentile) outcome level
4. Using a 50/50 interest rate forecast
5. after routine management / regulatory actions

This methodology produces an upper RSR target of $251 million (69% MCT) for the 2019/20 year. For reasons outlined in DCAT.1.7.3, MPI has not adopted this methodology. The MPI applied for methodology produces an upper RSR target of $305 million (85% MCT) for the 2019/20 year. MPI has also proposed that this upper RSR target be converted to an MCT ratio of 85% rather than a dollar amount.

Based on the above, the MPI applied for DCAT-based minimum $143 million capital target represents an MCT score of 34%, while the proposed maximum capital target of $305 million represents an MCT score of 85%. Assuming the DCAT analysis would produce a similar MCT score in future years, the table below shows the projected minimum and maximum RSR targets at 34% MCT and 85% MCT ratios over the forecast period. The 100% MCT target is also provided. The calculations assume that the Corporation's proposed RSR targets in 2019/20 will be approved by the PUB.

Figure DCAT- 11: Projected Regulatory Capital Targets

Line No.	Fiscal Year Beginning	Minimum RSR	Maximum RSR	100% MCT
1	*(in millions)*			
2	2019/20	$143	$305	$358
3	2020/21	$155	$337	$396
4	2021/22	$173	$363	$426
5	2022/23	$180	$380	$445

Note: The Corporation's Total Equity (RSR) balance is not equivalent to Capital Available in the MCT calculation. As a result of certain deductions that are included in the MCT calculation, the required Total Equity balance to achieve a 100% ratio will be higher than MCT Capital Available. The calculations above reflect the amount of Total Equity required for Basic to achieve a 100% MCT ratio in the given fiscal year. The MCT calculations for the base scenario and the selected adverse scenarios are provided in the appendices of this DCAT report.

DCAT.3.2 Materiality

As per Canadian actuarial standards of practice, an omission, understatement or overstatement is material if the actuary expects it to materially affect either the user's decision making or the user's reasonable expectations. We have judgmentally selected a materiality standard of $10 million, which is twice the materiality standard used in the *Part VIII EAR Attachment A - February 2018 Basic Appointed Actuary's Report*. The higher standard reflects the much greater uncertainty associated with the DCAT projections relative to the uncertainty of the base forecast. The materiality standard is approximately equal to 0.9% of projected net earned revenues for Basic in 2019/20.

Note: The materiality level is not intended to represent the range of reasonable values or the inherent uncertainty in an actuarial estimate.

DCAT.4 BACKGROUND DISCUSSIONS

DCAT.4.1 Description of Basic

MPI Basic is the Corporation's compulsory automobile insurance product. The Corporation has a monopoly on the sale of Basic products. The Basic coverages are as follows:

- All perils coverage with a $500 deductible
- No-fault accident benefits - Personal Injury Protection Plan (PIPP)
- Third Party Liability with a $200,000 limit.

DCAT.4.2 Recent and Current Financial Position

The table below provides the historical financial results for Basic over the previous five fiscal years.

Figure DCAT- 12: Historical Results

Line No.		2013/14	2014/15	2015/16	2016/17	2017/18
1	*(in millions)*					
2	Earned Revenues	$785	$823	$881	$928	$983
3	Total Claims Costs	$875	$874	$798	$994	$924
4	Expenses	$127	$136	$135	$140	$141
5	Investment Income	$148	$188	($4)	$83	$116
6	Net Income	($69)	($2)	($56)	($123)	$34
7	Rebates	$0	$0	$0	$0	$0
8	Transfers from Competitive Lines	$0	$76	$73	$28	$37
9	Retained Earnings	$100	$178	$194	$99	$211
10	AOCI[1]	$70	$35	$37	$82	$40
11	Total Equity[2]	$170	$213	$231	$181	$211
12	MCT Ratio[3]	41.60%	53.40%	48.61%	29.71%	44.11%

1. Accumulated Other Comprehensive Income
2. Total Equity = Retained Earnings + AOCI
3. Minimum Capital Test (MCT) Ratio. The 2017/18 MCT ratio is calculated based on the 2017 Guideline.

DCAT.4.3 Base Scenario

As per Canadian actuarial standards of practice (section 2520.17):

> *The base scenario would be a realistic set of assumptions used to forecast the insurer's financial position over the forecast period. Normally, the base scenario would be consistent with the insurer's business plan. The actuary would accept the business plan's assumptions for use in the base scenario unless these assumptions are so inconsistent or unrealistic that the resulting report would be misleading. The actuary would report any material inconsistency between the base scenario and the business plan.*

Details of the Corporation's base scenario are provided in the following sections.

DCAT.4.4 Description of Economic Assumptions in the Base Scenario

Volume growth: The number of insured units (excluding trailers and ORVs) is assumed to increase 1.50% per year over the forecast period, which is consistent with the historical averages. Trailers and ORVs have higher growth rates, but represent less than 1% of annual loss costs.

Vehicle Upgrade Factor: The average premium can increase or decrease without rate changes as customers' change their vehicle preferences (e.g. SUV's versus cars), where they live (e.g. Winnipeg versus rural), or how they use their vehicle (e.g. all purpose versus pleasure). The vehicle upgrade factor (excluding trailers and ORVs) is assumed to be 2.45% per year over the entire forecast period, which is equal to the most recent five year average. For more information see *Part V REV.1.2*.

Inflation: Projected Canadian Consumer Price Inflation (CPI) is forecasted to be 2.2% in 2018/19, 2.1% in 2019/20, and 2.0% thereafter. Projected Manitoba Consumer Price Inflation (CPI) is forecasted to be 2.0% over the five year forecast. Therefore, both CPI forecasts are projected at 2.0% per year. These rates are based on the

consensus forecast from various banks and economic forecasting firms rounded to the nearest 10 basis points. For more information see *Part VI INV.14.2*.

Interest rates and yields: The projected interest rates and yields for the investment portfolio are shown in the table below. The GoC 10 year bond rate forecast and the Canadian 91 Day T-Bill forecast was calculated using the naïve forecast[1]. The returns for MUSH (i.e. non-marketable provincial bonds), equities, real estate, and infrastructure are the Corporation's internal forecasts.

Figure DCAT- 13: Assumed Interest Rates and Yields

Line No.	Fiscal Year	CDN 91 Day T-Bill	Government of Canada 10 Year	Marketable Bond Yield	MUSH Rate	CDN/US/ Global Equities	Global Low Volatility Equities	Real Estate	Infrastructure
1	2018/19	1.15%	2.24%	3.20%	4.52%	7.00%	6.40%	6.20%	7.20%
2	2019/20	1.15%	2.24%	3.21%	4.47%	7.00%	6.40%	6.10%	7.10%
3	2020/21	1.15%	2.24%	3.21%	4.42%	7.00%	6.40%	6.00%	7.00%
4	2021/22	1.15%	2.24%	3.21%	4.36%	7.00%	6.40%	6.00%	7.00%
5	2022/23	1.15%	2.24%	3.20%	4.31%	7.00%	6.40%	6.00%	7.00%

*The interest rates and yields in the above table are for the fourth quarter of each fiscal year. The Corporation creates forecasts for each quarter (not shown).

Claims Liability Discount Rate: The present value of Basic claim liabilities is calculated using a discount rate based on the current average yields on the Corporation's fixed income portfolio. The assumed claim liability discount rates over the forecast period are shown in the table below.

Figure DCAT- 14: Assumed Claims Liability Discount Rate

Line No.	Fiscal Year End	Nominal	Real
1	2018/19	3.51%	1.48%
2	2019/20	3.47%	1.44%
3	2020/21	3.42%	1.39%
4	2021/22	3.37%	1.34%
5	2022/23	3.32%	1.30%

[1] The naïve forecast is the existing interest rate held constant for the entire interest rate forecast. The GoC 10 year bond rate forecast was 2.24%, which is based on the rate as of February 28, 2018.

Rate changes and Capital Build, Maintain, or Release

Vehicle premiums: The base forecast includes the following rate change and RSR rebuilding fee assumptions over the forecast period.

Figure DCAT- 15: Assumed Rate Changes, RSR Rebuilding Fees, and Capital Maintenance Provisions

Line No.	Policy Year	Rate Change	RSR Rebuilding Fee	Capital Maintence Provision
1	2018/19	2.6% (approved)	0.0% (approved)	0.0% (approved)
2	2019/20	0.1% (proposed)	0.0% (proposed)	2.1% (proposed)
3	2020/21	0.0% (assumed)	0.0% (assumed)	0.0% (assumed)
4	2021/22	0.0% (assumed)	0.0% (assumed)	0.0% (assumed)
5	2022/23	0.0% (assumed)	0.0% (assumed)	0.0% (assumed)

Per the above table, the Corporation has applied for a 0.1% rate increase, no RSR rebuilding fee, and a 2.1% capital maintenance provision in the 2019/20 policy year. The base forecast assumes the Corporation's rate increase proposal will be approved by the Regulator. For the reasons described in DCAT.1.2, the Corporation has not included the applied for CMP in the base scenario. In the 2020/21 to the 2022/23 policy years the base forecast assumes that there will be no additional rate changes, RSR rebuilding fees, or capital maintenance provisions.

Driver premiums: The Corporation has not proposed any changes to driver premiums in the 2019/20 policy year. The number of drivers is expected to grow at 1.50% per year based on historical trends.

Rebates: The base forecast assumes that no rebates will be ordered by the Public Utilities Board over the forecast period.

Reinsurance

The Corporation's reinsurance structure is as follows:

- Catastrophe program in excess of $15 million with a limit of $265 million.
- Casualty program with retention of $5 million and a limit of $50 million.

No changes in coverage are anticipated for the reinsurance program over the projection period.

Deferred Policy Acquisition Costs (DPAC) Write-Down and Premium Deficiencies

As of February 28, 2018, MPI Basic had a premium deficiency of $8.8 million and a $32.1 million deferred policy acquisition cost (DPAC) write-down. The table below shows the assumed changes in the premium deficiency and DPAC write-down over the forecast period. These amounts are included in the base forecast.

Figure DCAT- 16: Change in the Premium Deficiency or DPAC Write Down

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	Change in Premium Deficiency/DPAC	($29)	($5)	($4)	$4	$8

Base Forecast

The table below shows the Corporation's base forecast used in the DCAT report.

Figure DCAT- 17: Base Scenario – Includes 0.1% Rate Increase in 2018/19 and No Rate Changes, RSR Rebuilding Fees, or Capital Maintenance Provisions thereafter

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	Earned Revenues	$1,063	$1,126	$1,174	$1,222	$1,272
3	Total Claims Costs	$968	$1,058	$1,103	$1,164	$1,223

9	Total Equity	$254	$258	$262	$250	$226
10	MCT Ratio	69.49%	63.51%	58.30%	51.72%	42.50%

DCAT.4.5 Discussion of Prior Year's DCAT Results, Recommendations, and Management Actions

Last year's DCAT report dated July 13, 2017 found that the future financial condition of Basic was not satisfactory because Basic did not meet the PUB's assumed minimum capital target under the base scenario during the forecast period. The estimated PUB minimum capital target for 2018/19 was $201 million, which equated to a MCT ratio of 37%. Despite the Corporation's proposed 2.7% rate increase on 2018/19 vehicle policies and $17.5 million increase in driver vehicle premiums, the Corporation's base forecast projected that the MCT ratio would fall below 37% in the 2018/19 year. If no further management actions were taken, the MCT ratio was projected to fall to 26% by the 2021/22 year.

It was also noted in the report that Basic was currently operating at very low capital levels and does not earn a profit. As a result, there was no natural means by which to rebuild capital levels. The PUB responded to these concerns in Order 130/17 by directing MPI to attend a Technical Conference to discuss options for a CMP.

DCAT.5 ADVERSE SCENARIOS

DCAT.5.1 Summary of Results

A summary of the projected Total Equity and MCT scores for the selected 1-in-40 year adverse scenarios (before management and regulatory action) are shown in the table below. The adverse scenarios listed below are considered to have the most significant financial impact to the Corporation's financial position. All other risk categories are discussed in the 'Analysis of All Property and Casualty Insurer Risk Categories' section of this report.

Figure DCAT- 18: Total Equity – Adverse Scenarios before Management Action

Line No.	Scenario	2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	Base	$254	$258	$262	$250	$226
3	Combined Scenario	$254	$187	$150	$103	($36)
4	High Loss Ratio	$254	$194	$137	$66	$4
5	Interest Rate Decline	$254	$243	$211	$170	$116
6	Equity Decline	$254	$242	$234	$206	$165

Figure DCAT- 19: Minimum Capital Test Ratios – Adverse Scenarios before Management Action

Line No.	Scenario	2018/19	2019/20	2020/21	2021/22	2022/23
1	Base	69.49%	63.51%	58.30%	51.72%	42.50%
2	Combined Scenario	69.49%	41.27%	25.33%	11.10%	-25.54%
3	High Loss Ratio	69.49%	44.06%	22.50%	1.29%	-15.76%
4	Interest Rate Decline	69.49%	56.98%	41.32%	28.94%	13.68%
5	Equity Decline	69.49%	58.20%	50.46%	40.23%	27.25%

1. The MCT ratio can be negative even when Total Equity is positive because deferred development costs now require 100% capital. Therefore, it is possible for Total Equity to be positive while the MCT ratio is negative as long as the deferred development costs exceed the available capital.

Relative to the base forecast, the largest reductions in Total Equity (before management and regulatory action) for each return period and probability level are for

the Combined Scenarios. As a result, the Combined Scenarios at the 1-in-40 year probability level were used to apply assumed management and regulatory action, which are shown in the table below. The information in the table can be interpreted as follows: "Rate" means a rate increase for that policy year; "RSR" means an *additional* RSR rebuilding fee is applied in that policy year. E.g. For the 4 year Combined Scenario there is a total RSR rebuilding fee of 6% by the 2022/23 policy year.

Figure DCAT- 20: Assumed Management and Regulatory Action for Combined Scenarios

Line No.	Combined Scenarios	2019/20	2020/21	2021/22	2022/23
1	Base	0.1% Rate / 0% RSR			
2	1 year	0.1% Rate / 0% RSR	n/a	n/a	n/a
3	2 year	0.1% Rate / 0% RSR	0% Rate / 2% RSR	n/a	n/a
4	3 year	0.1% Rate / 0% RSR	0% Rate / 2% RSR	2% Rate / 2% RSR	n/a
5	4 year	0.1% Rate / 0% RSR	0% Rate / 2% RSR	3% Rate / 2% RSR	3% Rate / 2% RSR

The Combined Scenarios *including* the above management and regulatory action assumptions are shown in the table below.

Figure DCAT- 21: Total Equity – Combined Scenarios including Management Action

Line No.	Combined Scenario	2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	Base	$254	$258	$262	$250	$226
3	1 year	$254	$147	n/a	n/a	n/a
4	2 year	$254	$207	$122	n/a	n/a
5	3 year	$254	$197	$133	$130	n/a
6	4 year	$254	$187	$172	$206	$208

Figure DCAT- 22: Minimum Capital Test Ratios – Combined Scenarios including Management Action

Line No.	Combined Scenario	2018/19	2019/20	2020/21	2021/22	2022/23
1	Base	69.49%	63.51%	58.30%	51.72%	42.50%
2	1 year	69.49%	30.06%	n/a	n/a	n/a
3	2 year	69.49%	46.82%	17.40%	n/a	n/a
4	3 year	69.49%	44.14%	20.64%	17.89%	n/a
5	4 year	69.49%	41.27%	31.14%	37.35%	35.73%

Despite the significant reductions from the base forecast *before* application of management and regulatory actions, the Total Equity forecasts for all Combined Scenarios remains positive throughout the forecast period after management and regulatory action.

DCAT.5.2 Management and Regulatory Action

The following management and regulatory action assumptions were used for all adverse scenarios:

- Per discussions with management, we have assumed that the maximum combined rate increase and/or additional RSR rebuilding fee in a given rate application is 5.0%. In prior year's rate applications, the maximum additional RSR rebuilding fee approved by the PUB in a given year was 2.0%. The maximum rate increase approved by the PUB in the past 20 years was 4.1% in 1996. We believe this assumption is reasonable in light of the historical experience.
- Per discussions with management, we have assumed that there are no capital transfers between lines of business. Although transfers from the Corporation's competitive lines of business have occurred in the recent past, as of February 28, 2018 there were minimal amounts of excess capital in the competitive lines of business due to the magnitude of previous transfers to Basic. It is also the desire of the Executive that the indicated DCAT-based targets reflect the 'stand alone' result for the Basic line of business.
- 2019/20 Rate Application: Since the adverse scenarios do not occur until the 2019/20 fiscal year, we have assumed that none of the adverse scenarios would change the 0.1% break-even rate increase for in the 2019/20 rate application.
- 2020/21 Rate Application: Since the adverse scenarios are assumed to begin in the 2019/20 fiscal year and thereafter, it was assumed that the 2020/21 rate application *could* be impacted by the results of adverse scenarios if the impacts of these scenarios were apparent by the time the Corporation released its second quarter financial statements (or before the end of the October rate

hearings). Otherwise, it was assumed that the Corporation would not have full knowledge of the 2019/20 adverse scenarios at the time they put forward their 2020/21 rate application, and therefore, the adverse scenario would not impact the applied for rate change or RSR rebuilding fee.

- 2021/22 and 2022/23 Rate Applications:
  - The adverse scenarios will impact the rate and RSR rebuilding fee proposals in the 2021/22 and 2022/23 rate applications.
  - At each fiscal year end the break-even rate requirement for MPI Basic will be reassessed for the given rating period, and if necessary, rates will be assumed to increase to produce break even rates. The methodology for determining the revised forecasts, rate changes, and RSR rebuilding fees will be described with each adverse scenario (in the sections that follow).

DCAT.5.3 Decline in Equity Markets

Scenario Description

The Corporation's equity assets experience a decline beginning in the 2019/20 fiscal year.

Ripple Effects

None identified – other than those impacts already incorporated into the Corporation's financial model.

Changes from Last Year's DCAT Report

None.

Scenario Justification

The S&P/TSX Composite Total Return Index is used to model this scenario. The table below shows the actual total returns at the 0.5th, 1st, 2.5th, and 5th percentiles for the S&P/TSX Composite from 1956 to present (April 30, 2018).

Figure DCAT- 23: Historical Total Returns on the S&P/TSX by Percentile and Return Period (Cumulative)

Line No.			Return Period (Years)			
1	Time Period	Percentile	1	2	3	4
2	1956-present	0.5th	-33.18%	-33.42%	-26.32%	-11.14%
3	1956-present	1st	-32.19%	-29.04%	-24.25%	-9.18%
4	1956-present	2.5th	-25.84%	-23.19%	-11.37%	-2.81%
5	1956-present	5th	-17.22%	-15.32%	-5.90%	0.85%

Based on the historical results above, the Corporation's selected equity decline scenarios are based on fitted distributions that best represent the historical data. The assumptions are shown as total return in the table below.

Figure DCAT- 24: Selected Adverse Scenarios by Percentile and Return Period (Cumulative)

Line No.		Return Period (Years)			
1	Percentile	1	2	3	4
2	0.5th	-42.39%	-35.39%	-25.42%	-11.62%
3	1st	-35.44%	-29.81%	-20.82%	-8.83%
4	2.5th	-26.16%	-21.70%	-13.74%	-4.13%
5	5th	-19.01%	-14.87%	-7.41%	0.58%

Dividend Yield

The dividend yield used in the Equity Decline scenarios is the same dividend yield as the base forecast – see table below.

Figure DCAT- 25: Dividend Yield

Line No.	Index	Canadian Equities	U.S/Global/Global Low Vol Equities
1	2018/19	3.1%	2.4%
2	2019/20	3.2%	2.6%
3	2020/21	3.4%	2.7%
4	Thereafter	3.4%	2.7%

Dividend income is calculated based on the market value of the portfolio multiplied by the dividend yield. When the market value of the equity portfolio declines in the scenario analysis, dividends received as investment income also decline on a proportionate basis.

Realized Losses

Equity turnover indicates the rate at which gains or losses are realized in the equity portfolio on an annual basis. For Canadian equities, last year it was assumed that 20% of the unrealized losses were realized each year. For this year's report, Canadian equity turnover is assumed to be 0% for 2019/20 and thereafter. The turnover assumption changed because Canadian equity holdings are forecasted to be transferred into a pooled fund at the end of Q4 2018/19.

It is forecasted that the entire U.S. equity portfolio is assumed to be sold, and exposure is added to Global equity and Global low volatility equities at the end of Q4 2018/19. See *Part VI INV.2.2* for more information on this transition. Global equity and Global low U.S. equity portfolio are assumed to have a 0% turnover rate, which is the same turnover assumption in last year's report for the U.S. equity portfolio.

Rebalancing Assumptions

The Basic Claims asset allocation tolerance ranges for each asset class are summarized in the table below:

Figure DCAT- 26: Asset Allocation Tolerance Ranges (Basic Claims)

Line No.	Asset Class Group	Minimum	Target	Maximum
1	Fixed Income			
2	Provincial Bonds	50.0%	60.0%	70.0%
3	Corporate Bonds	15.0%	20.0%	25.0%
4	MUSH	15.0%	20.0%	25.0%
5	Total Fixed Income		100.0%	

The RSR asset allocation tolerance ranges for each asset class are summarized in the table below:

Figure DCAT- 27: Asset Allocation Tolerance Ranges (RSR)

Line No.	Asset Class Group	Minimum	Target	Maximum
1	Fixed Income			
2	Provincial Bonds	10.00%	20.00%	30.00%
3	Corporate Bonds	5.00%	10.00%	15.00%
4	MUSH	0.00%	5.00%	10.00%
5	Private Debt	0.00%	15.00%	20.00%
6	Total Fixed Income	40.00%	50.00%	60.00%
7	Public Equities			
8	Canadian Equities	9.00%	12.00%	15.00%
9	Global Equities	10.00%	13.00%	16.00%
10	Global Low Volatility	7.00%	10.00%	13.00%
11	Total Equities	25.00%	35.00%	45.00%
12	Alternatives			
13	Canadian Real Estate	7.00%	10.00%	13.00%
14	Infrastructure	2.00%	5.00%	8.00%
15	Total Alternatives	10.00%	15.00%	20.00%

Impairments

MPI's Impairment Policy is consistent with the IFRS Standards. Equities are held at market value on the financial statements. Therefore modeled losses are fully reflected in Total Equity at all times. When equities are impaired, the impairment reclassifies the loss from Accumulated Other Comprehensive Income to Net Income. This impairment reclassification does not have any impact on the reported Total Equity.

Impairments are recognized in the model based on the following conditions:

- If the market value falls below 80% of book value at a fiscal year end, impairment is recognized.
- If market value remains below 100% of the book value for a period longer than a year, then at the following fiscal year-end an impairment is recognized.

When the impairment occurs, the book value of the equity portfolio is adjusted to equal the market value.

Results before Management and Regulatory Action

The tables below show the projected Total Equity for each of the Equity Decline scenarios described above. The results are shown without management or regulatory action.

The highlighted cells indicate where the base forecast equity assumptions were used. The Corporation has identified these cells because the historical data indicates that equity returns are not independent from year-to-year (especially after large declines), and therefore, these results may not be plausible beyond the return period tested. The highlighted results are for information only and will not be used in the selection of the most adverse equity decline scenario.

Figure DCAT- 28: Decline in Equity Markets Scenario, Total Equity

Line No.	Probability	Return Period	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	1-in-200	1 year + base	$194	$203	$197	$179
3	1-in-100	1 year + base	$198	$213	$208	$190
4	1-in-40	1 year + base	$198	$218	$209	$188
5	1-in-20	1 year + base	$211	$227	$220	$199
6	1-in-200	2 year + base	$210	$190	$178	$155
7	1-in-100	2 year + base	$215	$198	$187	$165
8	1-in-40	2 year + base	$224	$209	$200	$177
9	1-in-20	2 year + base	$230	$218	$209	$187
10	1-in-200	3 year + base	$228	$214	$176	$154
11	1-in-100	3 year + base	$231	$218	$183	$161
12	1-in-40	3 year + base	$236	$225	$192	$172
13	1-in-20	3 year + base	$240	$230	$200	$180
14	1-in-200	4 year + base	$239	$229	$198	$155
15	1-in-100	4 year + base	$240	$231	$201	$159
16	1-in-40	4 year + base	$242	$234	$206	$165
17	1-in-20	4 year + base	$244	$237	$211	$171
18	Base		$258	$262	$250	$226
19	Difference from Base					
20	1-in-40, 1 year		($60)			
21	1-in-40, 2 year		($35)	($54)		
22	1-in-40, 3 year		($23)	($38)	($58)	
23	1-in-40, 4 year		($16)	($28)	($44)	($61)

Of the 1-in-40 probability scenarios, the largest overall decline in Total Equity relative to the base forecast (highlighted cells excluded) occurs for the four-year scenario ($61 million lower than the base forecast). The results for this scenario are shown in the table below and in *DCAT Appendix 2*.

DCAT.5.4 High Loss Ratio

Scenario Description

The Corporation experiences a significant increase in its loss ratio beginning in the 2019/20 fiscal year.

Changes from Last Year's DCAT Report

None.

Ripple Effects

Claims Expenses: The claims expenses, including internal claims adjustment costs (ICAC), were adjusted based on the increased level of claims costs. Claims expenses were restated using the cost allocation rules in the Corporation's financial model. ICAC was adjusted based on the estimated level of unpaid losses and incurred-but-not-reported (IBNR) at each fiscal year end.

Actuarial Adjustments: The claims impacts were estimated by simulating ultimate loss costs. The most adverse ultimate loss scenarios were then selected for input into the financial model (it is not practical to run every simulation through the financial model), which discounts and adjusts the ultimate losses for actuarial provisions for adverse deviation (per actuarial standards of practice).

Reinsurance: The adverse scenario was assumed to have no impact on future reinsurance premiums.

Premium Deficiency and/or Deferred Policy Acquisition Cost (DPAC) Write-Down: A significant increase in the loss ratio could result in unearned premiums being insufficient to cover expected claims costs and expenses. The impact of a premium deficiency/DPAC write-down is included in the simulated results.

Scenario Justification

Simulation of Ultimate Losses

The details of the simulation model are provided in *DCAT Appendix 6*.

Results before Management and Regulatory Action

The table below shows the results of the incurred simulations by probability level and return period along with a comparison to the base forecast. For each scenario, the results are shown assuming the simulated impact for the given return period and the

base forecast thereafter. We have assumed that claims costs deviations from the base forecast are independent from the previous year's deviations.

Figure DCAT- 31: High Loss Ratio Scenario, Total Equity

Line No.	Probability	Return Period	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	1-in-200	1 year + base	$123	$130	$125	$99
3	1-in-100	1 year + base	$146	$151	$146	$119
4	1-in-40	1 year + base	$167	$173	$166	$140
5	1-in-20	1 year + base	$182	$188	$181	$155
6	1-in-200	2 year + base	$100	$58	$54	$28
7	1-in-100	2 year + base	$140	$92	$88	$62
8	1-in-40	2 year + base	$169	$123	$118	$91
9	1-in-20	2 year + base	$195	$148	$141	$115
10	1-in-200	3 year + base	$130	$90	($2)	($29)
11	1-in-100	3 year + base	$137	$117	$30	$4
12	1-in-40	3 year + base	$181	$149	$74	$48
13	1-in-20	3 year + base	$210	$157	$106	$81
14	1-in-200	4 year + base	$247	$222	$123	($78)
15	1-in-100	4 year + base	$181	$122	$14	($39)
16	1-in-40	4 year + base	$194	$137	$66	$4
17	1-in-20	4 year + base	$242	$187	$129	$46
18	Base		$258	$262	$250	$226
19	Difference from Base					
20	1-in-40, 1 year		($91)			
21	1-in-40, 2 year		($89)	($139)		
22	1-in-40, 3 year		($77)	($113)	($176)	
23	1-in-40, 4 year		($65)	($125)	($184)	($222)

Based on the above results, the most significant adverse scenarios (relative to the base forecast) are the four year scenarios. We selected the four-year scenario (before management and regulatory action) at the 1-in-40 probability level for modeling purposes. The results for this scenario are shown in the table below and in *DCAT Appendix 3.*

DCAT.5.5 Interest Rate Decline Scenario

Scenario Description

Interest rates decline or remain at sustained low levels over the forecast period.

Ripple Effects

The impacts from interest rate changes are incorporated into the Corporation's financial model.

Changes from Last Year's DCAT Report

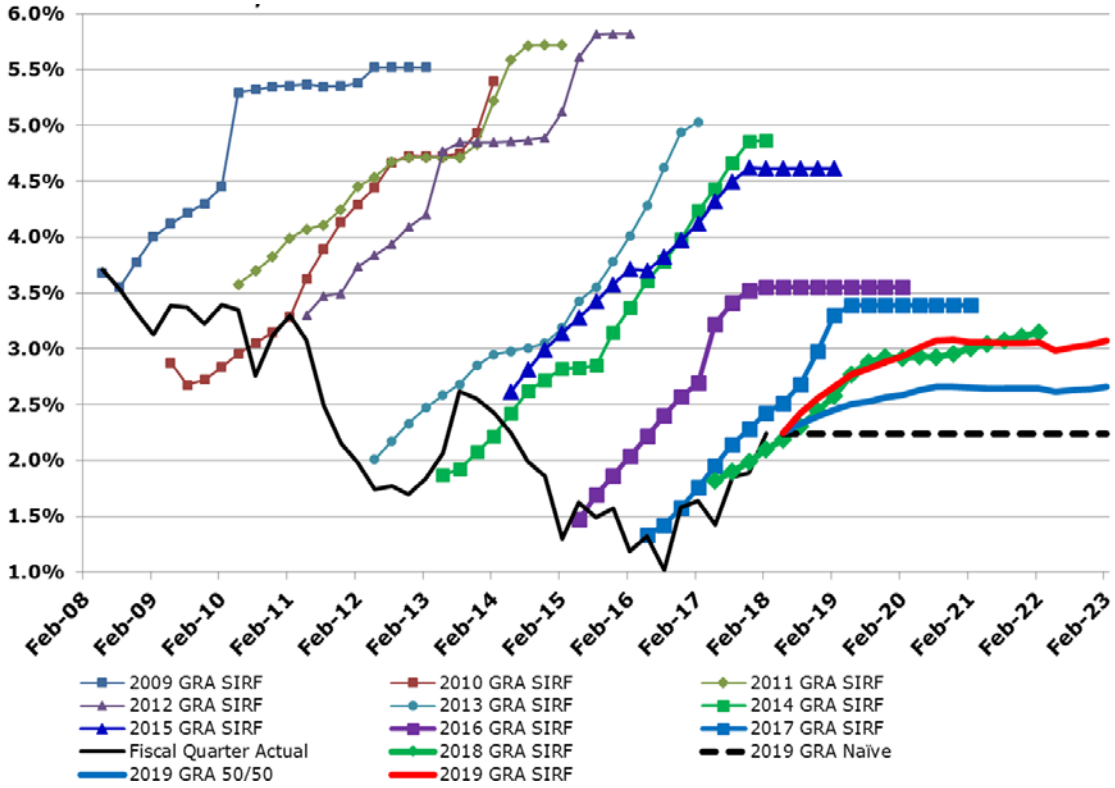
None

Scenario Justification

Based on the projected composition of the Corporation's assets and liabilities over the forecast period, a rising interest rate environment is expected to increase net income relative to the base forecast, while a declining interest rate environment is expected to decrease net income relative to the base forecast. Therefore, this adverse scenario assesses the risk that interest rates will decline from current levels as at February 28, 2018.

The table below shows the actual GOC 10 Year interest rates compared to the average forecasts from the 5 major Canadian Banks and Global Insight since 2008. In previous year's, the Corporation forecasted increasing interest rates based fully (i.e. standard interest rate forecast (SIRF) or partially (e.g. 50/50 interest rate forecast) on the bank forecasts. However, based on the poor performance of these forecasts (shown in the table below), the Corporation has moved to a naïve interest rate forecast (i.e. no change in interest rates).

Figure DCAT- 34: GoC 10 Year Forecasted Rates from 2009 to 2019 GRA and Actual



The Corporation's base forecast assumes the following GOC 10 Year interest rates.

Figure DCAT- 35: Assumed Bond Rates

Line No.	Fiscal Year	Government of Canada 10 Year	Corporate	Government/ Provincial	Marketable
1	2018/19	2.24%	3.90%	2.92%	3.20%
2	2019/20	2.24%	3.90%	2.95%	3.21%
3	2020/21	2.24%	3.90%	2.95%	3.21%
4	2021/22	2.24%	3.90%	2.94%	3.21%
5	2022/23	2.24%	3.90%	2.94%	3.20%

Assumptions

Changes in the GoC 10 year bond rates impact both the fixed income portfolio and the claims liabilities valuation (which uses the fixed income portfolio yield to calculate the present value of the liabilities). In particular, changes in the GoC 10 year bond rates impact the gains/losses on marketable bonds and the yield on new MUSH purchases.

Changes in the marketable bond yield, which consists of the forecasted GoC 10 year bond rate plus a spread based on the marketable bond duration, impacts the claims liability discount rate.

The dataset used in this scenario is the historical long-term bond yield series from the Bank of Canada (BoC) from 1956 to April 2018.[2] Long-term bond yields include bonds with a term of 10 years or longer (i.e. 10+ years). The entire dataset for BoC long-term bond yields is available from January 1949 to present. However, since the equity return history used in this DCAT analysis is from 1956 to present, the data from 1949 to 1955 was removed from the dataset for consistency. Also, based on prior year's discussions at the PUB hearings and the DCAT collaborative process, the observed interest rates in the period between 1976 and 1985 (referred to as the "stagflation period") were not included in the modeling of interest rate movements.

Long-term bond yields were used instead of the GoC 10 year bond yields because the GoC 10 year bond yield dataset is only available from June 1989. Applying the historical change in long-term bond yields (10+ years) instead of applying the historical change in the GoC 10 year bond rate is a reasonable assumption for this analysis. This assumption holds true if there is a parallel shift in the yield curve when interest rates decline. Therefore, it is assumed in this scenario that there is a parallel yield curve shift when interest rates change. The table below shows the actual decline in long-term bond yields by percentile.

Figure DCAT- 36: Historical Declines in Long-Term Bond Yields (1956 to April 2018 excluding Stagflation Period)

Line No.			Period (Years)			
1	Time Period	Percentile	1	2	3	4
2	1956-present	0.5th	-2.06%	-2.83%	-3.54%	-3.96%
3	1956-present	1st	-1.93%	-2.58%	-3.40%	-3.87%
4	1956-present	2.5th	-1.55%	-2.39%	-3.04%	-3.08%
5	1956-present	5th	-1.30%	-1.98%	-2.57%	-2.35%

[2] V122487 series from the BoC.

Based on the historical results above, the Corporation selected interest rate decline scenarios based on fitted distributions selected to best represent the historical data. The assumptions are shown in the table below.

Figure DCAT- 37: Selected Adverse Scenarios by Percentile and Period (Cumulative)

Line No.		Period (Years)			
1	Percentile	1	2	3	4
2	0.5th	-2.28%	-2.92%	-4.48%	-3.87%
3	1st	-1.99%	-2.66%	-3.84%	-3.53%
4	2.5th	-1.60%	-2.25%	-3.00%	-3.03%
5	5th	-1.30%	-1.89%	-2.36%	-2.60%

In addition to using the long-term bond yield dataset, for DCAT purposes we have made the following assumptions:

- The decline in interest rates starting in 2019/20 is based off of the Q4 2018/19 forecasted rate of 2.24%.
- For the one year scenario, the entire interest rate decline occurs in Q1 2019/20. For the two year scenario, half of the modeled interest rate decline occurs in Q1 2019/20 and half in Q1 2020/21. For the three and four year scenarios, the modeled interest rate decline occurs in Q1 of each year on a linear basis similar to the two year scenario.
- An interest rate floor of 1.00% is applied to the interest rate scenarios if the forecasted interest rate falls below this level. The interest rate floor of 1.00% is based on the lowest monthly GoC 10 year bond yield from 1989 to present.

To illustrate the modeled interest rates and the application of the interest rate floor, below are two charts showing the 1-in-40 year interest rate decline scenarios over 1, 2, 3, and 4 years. The first chart shows the modeled interest rate decline without the 1.00% floor. The second chart shows the modeled interest rate decline with the 1.00% floor.

Figure DCAT- 38: Interest Rate Decline Scenario, 1-in-40 Year Scenarios (Without 1.00% Floor)

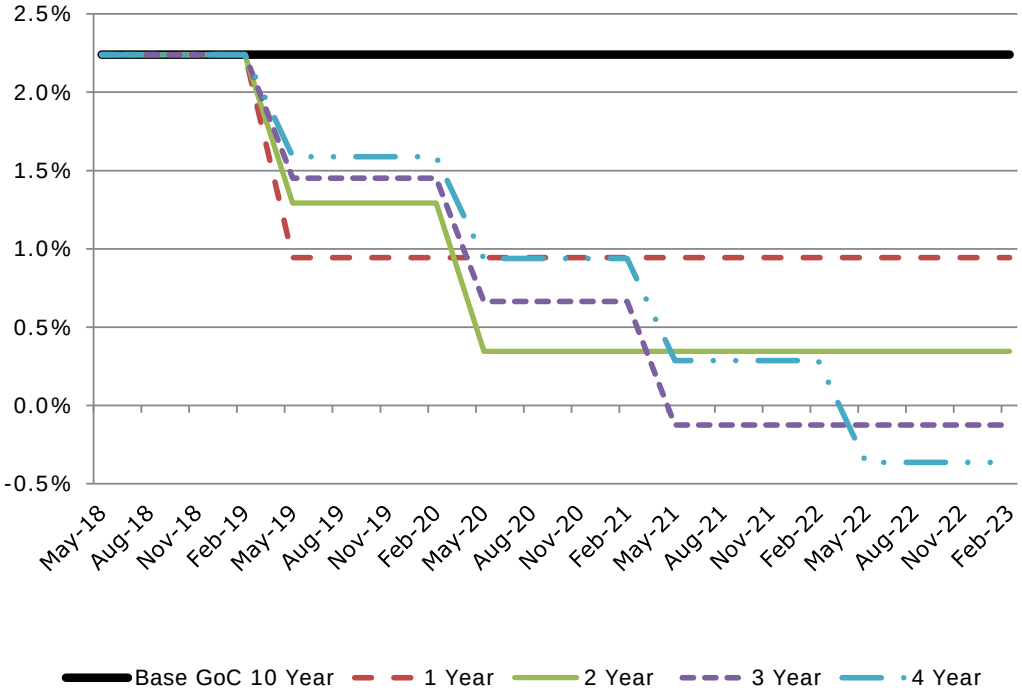


Figure DCAT- 39: Interest Rate Decline Scenario, 1-in-40 Year Scenarios (With 1.00% Floor)

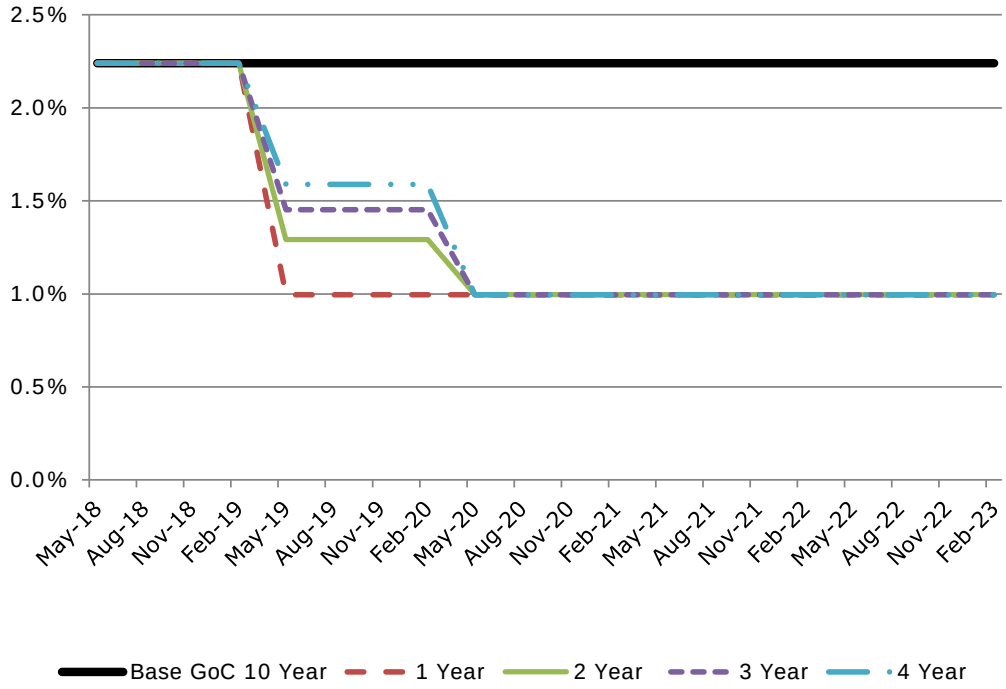

The table below shows the projected Total Equity for each of the Interest Rate Decline scenarios described above. The results are shown without management or regulatory action.

The highlighted cells indicate where the interest rate forecast was assumed to return to the annual growth rates assumed in the base forecast. We have identified these cells because these years were not modeled based on historical data, and therefore, the results may not be plausible beyond the return period tested. The highlighted results are for information only and will not be used in the selection of the most adverse interest rate scenario.

Figure DCAT- 40: Interest Rate Decline Scenario, Total Equity

Line No.	Probability	Return Period	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*

DCAT.5.6 Combined Scenario: Equity Returns, Interest Rates, and High Loss Ratio

Scenario Description

The Corporation experiences a significant deterioration in its financial condition as a result of the combined impacts of equity returns, interest rates, and claims experience.

Ripple Effects

The ripple effects are as described in the Decline in Equities scenario, the High Loss Ratio scenario, and the Interest Rate Decline scenario.

Changes from Last Year's DCAT Report

None

Scenario Justification

Integrated Scenario

An integrated scenario is a type of adverse scenario that results when two or more adverse scenarios are combined. The adverse scenarios to be combined may be based on correlated or uncorrelated risk factors but the resulting integrated scenario would be realistic and plausible at the same 1% to 5% probability levels of the single-risk adverse scenarios.

Our simulation assumes that undiscounted claims costs are independent of interest rates and equity returns. Therefore, for claims costs the methodology used is as described in the High Loss Ratio scenario and in *DCAT Appendix 6* on stochastic modeling.

For interest rates and equity returns, the correlation coefficients between these two variables from 1956-present are shown in the table below. Based on the historical data, we have assumed that equity returns and interest rate movements have zero correlation in our modeling.

Figure DCAT- 43: Correlation between Equity Returns and Interest Rate Movements

Line No.	Return Period	1956 to Present
1	1-Year	(0.11)
2	2-Year	0.04
3	3-Year	0.05
4	4-Year	0.06

5 The figures in bold are significantly different from 0 with Type-1 error of 5%.

1 The interest rate 'floor' methodology (as described in the Interest Rate Decline
2 section) was again used when modeling interest rates.

3 *Corporate Bonds*

4 The Corporation used 25 years of Moody's data from 1989 to 2013 to model Canada
5 Corporate Bond default rates. The table below outlines the default rates by Corporate
6 Bond level.

Figure DCAT- 44: Canadian Corporate Bond Default Rate Analysis

28	average	0.00%	0.00%	0.28%	0.94%	7.91%

Modeling Process

To model the financial impact of defaulting Canadian Corporate Bonds, the Corporation used a fitted distribution to the percentiles of the historical data plus a 99th percentile from the MCT.

Figure DCAT- 45: Fitted Canadian Corporate Bond Default Rates

Line No.	Percentile	Fitted	Actual
1	92nd	2.58%	2.60%
2	96th	4.38%	4.40%
3	99th	5.29%	5.30%

Overall Results

To produce the combined equity return, interest rates, claims incurred, corporate bond model, 5,000 simulations were conducted for each return period using the following process:

- Simulate undiscounted claims costs for the given return period.
- Simulate the combined equity returns, corporate bond default impacts, and interest rates for the given return period.
- Run the simulated scenarios through the financial model to determine the full financial impact including all applicable financial adjustments.
- Calculate the financial impact (relative to base) over the return period for Total Equity.
- Order the scenarios from most unfavourable to most favourable financial impacts and select the 0.5th, 1st, 2.5th, and 5th percentiles.

Results without Management or Regulatory Action

The table below summarizes the Total Equity projections for the Combined Scenarios. As discussed in the Decline in Equity Markets and Interest Rate Decline scenarios, the highlighted cells indicate where the base forecast was assumed for equity returns and

interest rates, which is not reflective of actual historical experience. These results are for information only and will not be used in the selection of the most adverse Combined Scenarios.

Figure DCAT- 46: Combined Scenario, Total Equity

Line No.	Probability	Return Period	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	1-in-200	1 year + base	$95	$82	$57	$11
3	1-in-100	1 year + base	$117	$120	$97	$52
4	1-in-40	1 year + base	$147	$153	$141	$108
5	1-in-20	1 year + base	$167	$171	$152	$113
6	1-in-200	2 year + base	$160	$42	$5	($51)
7	1-in-100	2 year + base	$135	$59	$24	($34)
8	1-in-40	2 year + base	$207	$100	$65	$7
9	1-in-20	2 year + base	$232	$126	$87	$33
10	1-in-200	3 year + base	$142	$31	($46)	($103)
11	1-in-100	3 year + base	$181	$103	$3	($54)
12	1-in-40	3 year + base	$197	$111	$39	($13)
13	1-in-20	3 year + base	$227	$139	$75	$23
14	1-in-200	4 year + base	$185	$117	($39)	($122)
15	1-in-100	4 year + base	$193	$126	($5)	($63)
16	1-in-40	4 year + base	$187	$150	$103	($36)
17	1-in-20	4 year + base	$180	$139	$89	$5
18	Base		$258	$262	$250	$226
19	Difference from Base					
20	1-in-40, 1 year		($111)			
21	1-in-40, 2 year		($51)	($162)		
22	1-in-40, 3 year		($61)	($151)	($211)	
23	1-in-40, 4 year		($71)	($112)	($147)	($262)

Based on the above, we selected the four-year, 1-in-40 scenario for financial modeling purposes. This scenario, one of many possible combinations of claims, equity returns, interest rates, and corporate bonds that produce the same result, uses the following assumptions over the forecast period (2019/20 to 2022/23):

- Ultimate claims cost are over budget by a cumulative $126 million (or an average of $32 million over budget per year).

- The four-year (cumulative) Total Equity return is 6.45% relative to the four-year base forecast return of 31.3%.
- Corporate bonds default resulting in a 3.17% default (over the 4 year period).
- The GoC 10-year bond rates are assumed to be as follows at each year-end:
  - 2018/19: 2.24% (base forecast)
  - 2019/20: 1.00%
  - 2020/21: 1.00%
  - 2021/22: 1.00%
  - 2022/23: 1.00%

The results for the selected Combined Scenario are shown in the table below.

Figure DCAT- 47: Combined Scenario

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23

DCAT.5.7 Selection of Most Adverse Scenarios after Management and Regulatory Action

At the selected 1-in-40 year risk tolerance level, the most adverse scenarios at each return period are the Combined Scenarios. As a result, we have selected the Combined Scenarios for application of management and regulatory action assumptions.

Per the Management and Regulatory Action section of this report, we have assumed that the maximum *additional* RSR rebuilding fee in a given policy year is 2.0% and that the maximum combined rate increase and additional RSR rebuilding fee in a given policy year is 5.0%. In general we have assumed that adverse scenarios with shorter return periods (e.g. 2 year) will require a more immediate management response than adverse scenarios with longer return period (e.g. 4 years). The reason being that for longer term adverse scenarios the ultimate severity of the situation may not be apparent in year one or two of the scenario, while for shorter term adverse scenarios it will be very apparent that the Corporation requires management action. The management and regulatory action assumptions for each Combined Scenario are described below.

1-year, 1-in-40 Combined Scenario

Figure DCAT- 49: 1-year, 1-in-40 Combined Scenario before Management Action

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	Total Equity	$254	$147	$153	$141	$108
3	Difference from Base	$0	($111)	($109)	($110)	($118)
4	MCT Ratio	69.49%	30.06%	27.65%	22.14%	12.01%

The entire impact of this adverse scenario occurs in the 2019/20 fiscal year. There is no management and regulatory action that can reduce the severity of this scenario in 2019/20 since the rates for that year will already be applied at the time the adverse scenario is occurring.

2-year, 1-in-40 Combined Scenario

Figure DCAT- 50: 2-year, 1-in-40 Combined Scenario before Management Action

Line No.		2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	Total Equity	$254	$207	$100	$65	$7
3	Difference from Base	$0	($51)	($162)	($185)	($219)
4	MCT Ratio	69.49%	46.82%	11.46%	1.08%	-14.55%

We have assumed that the PUB will approve a cumulative 2.0% rate increase and/or RSR rebuilding fee in the 2020/21 application in response to this adverse scenario. The timing of this adverse scenario impacts the management action. For example, if the majority of the adverse impact occurs in 2019/20, then there will likely be a more significant management and regulatory response. For consistency, we have applied a 2.0% management action per previous years. The results for this scenario including management action assumptions are provided below.

Figure DCAT- 51: 2-year, 1-in-40 Combined Scenario including Management Action

We have assumed that the severity of this adverse scenario will be apparent at the time of the 2020 GRA hearings in October 2019. We have a cumulative rate increase and/or RSR rebuilding fee of 2.0% in the 2020 application.

In the 2020/21 fiscal year the severity of this adverse scenario will be very apparent to the Corporation and the Regulator. Even with the approved RSR rebuilding fee in the 2020 rate application, the Corporation will likely be projecting a Total Equity balance and an MCT ratio below the target for satisfactory future financial condition. We have assumed that continued low interest rates, poor claims experience, and underperforming equity returns will result in the approval of a 2.0% rate increase on 2021 rates; while the low RSR balance will result in the approval of an additional 2.0% RSR rebuilding fee.

The results for this scenario including management action assumptions are provided below.

Figure DCAT- 54: 3-year, 1-in-40 Combined Scenario including Management Action

We have assumed that the PUB would approve a 2.0% RSR rebuilding fee on 2020 rates. In the 2020/21 and 2021/22 fiscal years we assumed that the severity of this scenario would be apparent at the time of the 2021 and 2022 rate hearings. We assumed a full management response of the maximum 5.0% combined rate increase and RSR rebuilding fees on 2021 and 2022 rates. The management and regulatory actions will depend on the specifics of each scenario. We have kept our assumed actions consistent with prior year's DCATs.

The results for this scenario including management action assumptions are provided below.

As shown in the table above, MPI Basic maintains a positive Total Equity balance for all 1-in-40 year adverse scenarios tested in this report. The next step is to determine the adverse scenario that requires the largest starting Total Equity balance as of the beginning of the 2019/20 fiscal year such that all 1-in-40 year adverse scenarios maintain a positive Total Equity balance above zero over the assumed return period. As shown in the table below, the minimum Total Equity balance such that all of Combined Scenarios after assumed management action remain above zero is $143 million. Similar to last year, the most adverse scenario is the two-year, 1-in-40 Combined Scenario.

Figure DCAT- 62: Minimum Total Equity Balance as of the end of Fiscal 2018/19. Combined Scenario Basic Total Equity after Management Action

Line No.	Combined Scenarios	2018/19	2019/20	2020/21	2021/22	2022/23
1	*(in millions)*					
2	1 year	$103	$0	($1)	($21)	($61)
3	2 year	$143	$90	$0	($18)	($58)
4	3 year	$140	$78	$9	$0	$14
5	4 year	$100	$24	$0	$25	$20

Recommendation

Basic currently has sufficient Total Equity to withstand all adverse scenarios (including management and regulatory action) at the 1-in-40 year probability level.

Reconciliation

DCAT Appendix 5 provide detailed financial model results for the two-year, 1-in-40 Combined Scenario with and without management action.

DCAT.5.8 Analysis of All Property and Casualty Insurer Risk Categories

Catastrophe

The Corporation's major catastrophe exposure is from hail storms. The modeling of hail losses is included as part of the High Loss Ratio (Claims Incurred) scenario.

Loss Ratio

The detailed assumptions and results of this scenario are presented in *DCAT.5.4*.

Underestimation of Policy Liabilities Risk

Modeling a policy liability scenario based on the Corporation's historical runoff behaviour is likely not a good predictor of future experience, as the most significant changes that occurred in previous valuations may legitimately be one-time events (e.g. changes to a mortality table). Also, a portion of what is included in the historical runoff may already be partially accounted for in either the loss ratio adverse scenario and/or the interest rate adverse scenario, so adjustments would have to be made to isolate the specific impacts.

The Corporation has very consistent paid loss development experience in the tail of long duration PIPP claims, and there does not appear to be any significant changes to the paid loss development patterns or to the mortality experience of lifetime claimants (see sections below). The Corporation compared its long-tail development experience and forecasted development patterns to Société de l'assurance Automobile du Québec (SAAQ) and Saskatchewan Government Insurance (SGI) and found that MPI's results

are highly correlated with the actual and projected data of these jurisdictions (see below).

Finally, the most significant unfavourable runoff experience from prior year was still significantly lower than the minimum DCAT targets proposed by the Corporation.

Despite the above, the risk of unfavourable variations in policy liabilities does exist. The Corporation will conduct further research on this topic for the 2019 DCAT.

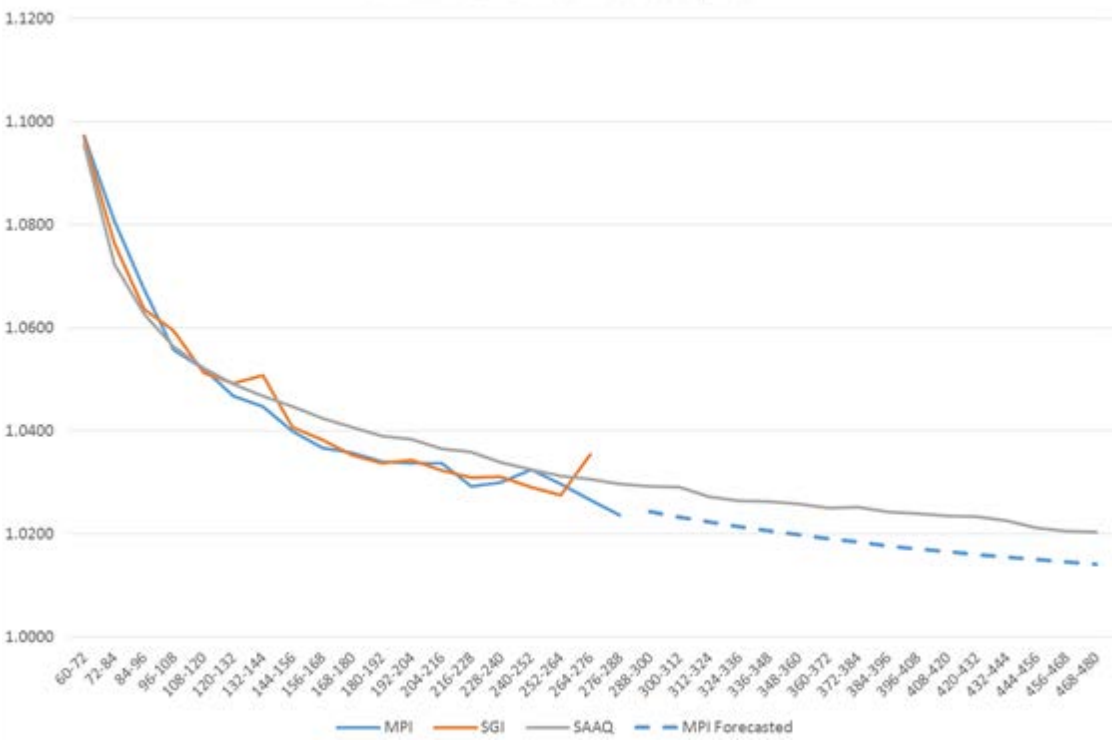
Variability of Paid Losses: The table below provides the observed average and standard deviation of paid loss development factors (LDFs) from 60 months (5 years) to 180 months (15 years) for Weekly Indemnity coverage. Although there has been an increase in the number of injury claims remaining open beyond 60 months, the variability of historical paid development on this coverage continues to be very low beyond 60 months.

Figure DCAT- 63: Variability in Weekly Indemnity Paid LDFs

Line No.	Development Months	Weekly Indemnity Average	Weekly Indemnity Stdev
1	60-72	1.0888	0.0136
2	72-84	1.0724	0.0142
3	84-96	1.0613	0.0124
4	96-108	1.0506	0.0087
5	108-120	1.0475	0.0107
6	120-132	1.0431	0.0097
7	132-144	1.0417	0.0076
8	144-156	1.0361	0.0056
9	156-168	1.0344	0.0051
10	168-180	1.0306	0.0047

The Corporation also conducted a comparison of long-tail development experience for income replacement benefits between SGI and SAAQ. The table below shows the actual and projected paid development factors for MPI relative to SGI and SAAQ. The Corporation believes its development projections are almost perfectly aligned with the long-tail experience of SAAQ, which has significantly more development history than MPI.

Figure DCAT- 64: Income Replacement Paid Loss Development Factors by Company – 60 months to 480 months of development



Mortality Improvements

The Corporation uses a disabled mortality table based on the Canadian Institute of Actuaries July 1992 research paper "Accident Benefits Long-Term Disability Losses". The historical experience of the Corporation's actual versus expected claim closure rates for long-term (i.e. open more than 10 years) claimants is shown in the table below. Based on these results, we do not believe there is significant risk that the Corporation's mortality assumptions are understating the lifetimes of long-term claimants. Note: The observed favourable or unfavourable claim closure rates are reflected in the selected loss development factors for PIPP coverages in the Appointed Actuary's report (where at least five years of loss development experience is available).

In the table below, the "number of claimants at the start of the year" represents the number of claimants that received a claim payment of any amount in the previous 12 months. A claim is then considered "closed" if there are no payments made in a given

calendar year. A "relapse" means that a claimant started receiving payments in the current year after not having received payment in the prior year(s).

Figure DCAT- 65: For PIPP Claims Open More than 10 years

Line No.	Calendar Year	Actual Terminations	Current Table Expected Terminations	Actual Termination Rate	Expected Termination Rate	Difference	Relapses	Relapse Rate

10	Total	202	189	4.47%	4.18%	0.29%	34	0.75%

Interest Rate Adjustments

The impact of interest rate adjustments on the value of claims liabilities is included in the Interest Rate Decline scenario and the Combined scenario.

Claim Liabilities Stress Tests

As of February 28, 2018, MPI Basic net claim liabilities were $1,806 million. A 10% increase in net claim liabilities over the five year forecast period that is unrelated to changes in interest rates would result in a $181 million impact to net income. An increase in claim liabilities of over $100 million (excluding the impact of interest rates) would be required to make this risk a top three adverse scenario. Based on the discussions above regarding changes in claims persistency, historical paid loss development, and mortality assumptions, we do not believe that such an increase is plausible at the 1-in-40 year level.

Government and Political Action

We assumed that it was very unlikely that government action (e.g. retroactive increase in benefits) that resulted in a significant impact to existing and/or future claim liabilities would be made without advance notice to the Corporation.

Inflation Risk

We reviewed the Canada All-Items Consumer Price Index (Canadian CPI) from the BoC website for two different historical periods: (i) 1914 to 1991 and (ii) 1992 to 2017 (the BoC inflation targeting era). As shown in the table below, the means and standard deviations of year-over-year changes in Canadian CPI are significantly different in these two periods.

Figure DCAT- 66: Canadian CPI

Line No.	Period	Mean	Standard Deviation
1	1915-1991	3.60%	5.40%
2	1992-2017	1.80%	0.70%

The observed 97.5th percentile of 1915-1991 Canadian CPI over a four year period is 11.1%. We did not believe it was reasonable to consider these results in light of the very stable inflation experience observed since 1991. We based our assessment of inflation risk on the recent period (1992-present).

We tested a sustained increase in inflation of 2.8% from 2019/20 to 2022/23, which was estimated as a 1-in-40 year event based on the 1992 to present Canadian CPI figures. We assumed that (i) the severity of all new claims in these periods would increase by the additional (compounded) inflation amount, (ii) PIPP claims from prior years would be indexed at the observed inflation, and (iii) the long term inflation projection of 2.0% would not change. The impact of these assumptions did not represent a top three adverse scenario. The assumption that the long-run inflation expectation of 2.0% would not change significantly reduces the potential impact of this scenario to the value of assets, claim liabilities, and pension liabilities.

Premium Risk

MPI Basic is a monopoly insurance provider of compulsory automobile insurance. Premium risk is not a significant risk factor.

Reinsurance Risk

As of February 28, 2018 MPI Basic had approximately $1.3 million in ceded claim liabilities. The impact of any reinsurance risk scenario is not a top three adverse scenario for the Corporation.

Investment Risk

Equities: This risk was analyzed in *DCAT.5.3*.

Fixed Income: The Interest Rate Decline scenario was analyzed in Section 6. The Corporation has an ALM strategy that requires (i) the average duration of the corporate fixed income portfolio be equal to the average duration of corporate claim liabilities, and (ii) the dollar value of the corporate fixed income portfolio be equal to the corporate claim liabilities. This strategy is designed to minimize net interest rate risk between assets and liabilities.

Corporate Bonds: This risk was discussed in *DCAT.5.6*.

Private Debt: This risk was included in *DCAT.5.5*.

Other Asset Categories: There are several other asset categories included in the base forecast that were not discussed as part of an adverse scenario, such as real estate, non-marketable bonds, and infrastructure. The most significant asset class not included was real estate, which represented 10.9% of the total portfolio at the end of 2017/18. As a result of the recommendations from the 2017 ALM study, the Basic line of business exposure to real estate was a forecasted average allocation of 1.5% from 2019/20 to 2022/23. This asset class is included to provide diversification to the fixed income and equity asset classes. Based on available historical institutional real estate

and equity data, there were no combined equity and real estate scenarios that were determined to be a top three adverse scenario.

Non-marketable bonds represented 22.1% of the total portfolio at the end of 2017/18. The financial impact of non-marketable bonds is limited since the asset class is held at book value on the financial statements.

Infrastructure was 3.6% of the total portfolio at the end of 2017/18. The Basic line of business exposure to infrastructure declined to a forecasted average allocation of 0.8% from 2019/20 to 2022/23 as a result of the recommendations from the 2017 ALM study. This asset class, similar to real estate, is expected to provide diversification to the total portfolio and has limited exposure in the total portfolio.

Off-Balance Sheet Risk

None of the following off-balance sheet items were determined to be significant risk factors for MPI Basic:

- Structured settlements
- Contingent liabilities or losses
- Derivative instruments
- Pension underfunding

Related Company Risk

We had discussions with management about the plausibility of MPI Basic transferring Retained Earnings to the Corporation's Extension or Special Risk Extension lines of business. This scenario was not seen as plausible.

International Financial Reporting Standards (IFRS)

In May 2017, the IASB issued IFRS 17 on the accounting for insurance contracts. The changes under IFRS 17 would come into effect in 2021/22, but could potentially be implemented earlier by the Corporation.

From a DCAT perspective, the most significant financial risk from IFRS is from changes in the discounting of policy liabilities. Currently, the policy liabilities are discounted based on the assets backing the liabilities (MPI uses fixed income assets) plus a provision for adverse deviation (PfAD) on the assumed investment return. However, under IFRS 17 the liabilities will be discounted using a risk-free rate plus a liquidity premium. The provision for adverse deviation will be removed or reduced under IFRS 17.

As of May 31, 2018, if the yield on the Corporation's government bond portfolio was used as a proxy for the 'risk free rate', then the discount rate used in the valuation of Basic claims liabilities would decrease by approximately 50 basis points. However, the actuarial PfAD (which is being eliminated under IFRS) is currently set at 50 basis points, so the two amounts would largely offset (in theory). A liquidity premium would then increase the discount rate, which would decrease the present value of the claims liabilities with no offsetting impact from the fixed income portfolio, causing a favourable impact to net income. If the Corporation increases its allocation to higher yielding bonds, then there is greater risk that these amounts will not offset.

More research is required on this topic over the next fiscal year; however, the Corporation appears to be well positioned financially to make this transition, especially relative to insurance companies that are discounting their liabilities using assets with much higher assumed returns.

DCAT.6 MAXIMUM CAPITAL TARGET

The DCAT-based minimum capital target utilized by the PUB is, by definition, calculated to be the absolute minimum amount of capital *including* management action that Basic can hold to withstand all 1-in-40 adverse scenarios. This minimum amount should never be considered an optimal capital level for a financially prudent entity. A capital range above the minimum amount is needed for the Corporation to be fiscally responsible and to allow the Rate Stabilization Reserve to achieve its purpose.

The Corporation has calculated the appropriate size of the RSR range by using the DCAT analysis and the following assumptions:

(i) Risk tolerance: 1-in-40
(ii) Time Horizon: 2 years
(iii) Assumed Management Action: None
(iv) Scenario: Combined Scenario

The calculated RSR range based on these parameters was assumed to be added to the minimum RSR target to produce the maximum RSR target. The calculated ranges and implied RSR upper targets using the above parameters are shown in the tables below. For information, we have also provided the size of the RSR range at a 1-in-20 probability level (5th percentile) and over a 3-year forecast period.

1	*(in millions)*		
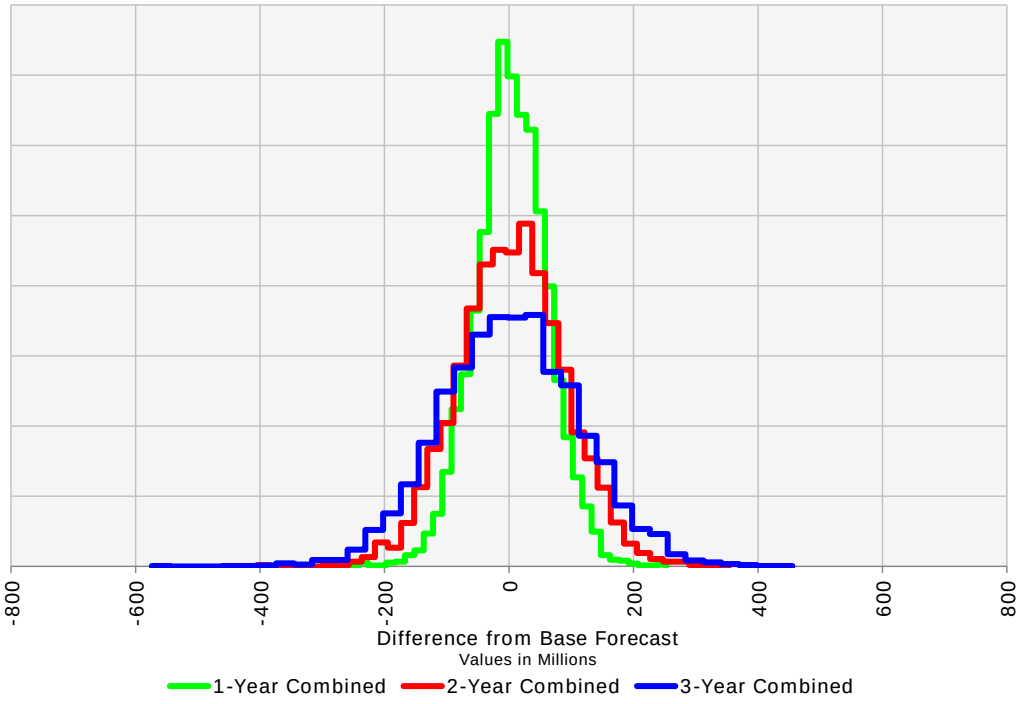
2	2.5th	$305	$354
3	5th	$279	$318

The graph below shows the full modeled results for the Combined Scenario before management action over 1, 2, and 3 year forecast periods.

Figure DCAT- 69: Combined Simulations of Total Equity



The Corporation's proposed approach results in a lower RSR target of $143 million and an upper RSR target of $305 million. Provided the Corporation is operating within this range there would be an expectation of no rebuilding fees and no premium rebates.

Appendix 6: STOCHASTIC MODELING

PUB Order 122/10

In PUB Order 122/10 the Public Utilities Board ordered the following:

> *"MPI shall use stochastic modeling of claims incurred for rate-setting purposes".*

The Corporation created the Stochastic Modeling section in the DCAT report in response to the above PUB Order.

What is Stochastic Modeling?

A stochastic model is a model that estimates the probability distribution for a given outcome by allowing certain inputs to be random variables rather than fixed estimates. A random variable is allowed to take on a range of values based on the assumed distribution of that variable. The stochastic model creates a distribution of outcomes by running a large number of simulations using the random inputs.

Stochastic Modeling of Claims Incurred

For stochastic modeling of claims incurred the distribution being estimated is the claims incurred by coverage. The random variables in the simulation could include factors such as:

- Frequency
- Severity
- Volume growth

The stochastic claims incurred model would then be repeatedly simulated to provide information on the following:

- Expected (average) outcome
- Variability of outcomes
- Probability of various outcomes
- Shape of the distribution (e.g. Normal versus skewed).

Stochastic modeling of claims incurred cannot be used 'for rate setting purposes' as the Corporation still requires a fixed best estimate forecast for setting rates. However, the output from the model can assist the rate setting process by:

- Determining the reasonability of the Corporation's best estimates
- Determining if past forecast errors are due to chance
- Determining the source of forecasting errors
- Improve the forecasting process by better understanding the key inputs

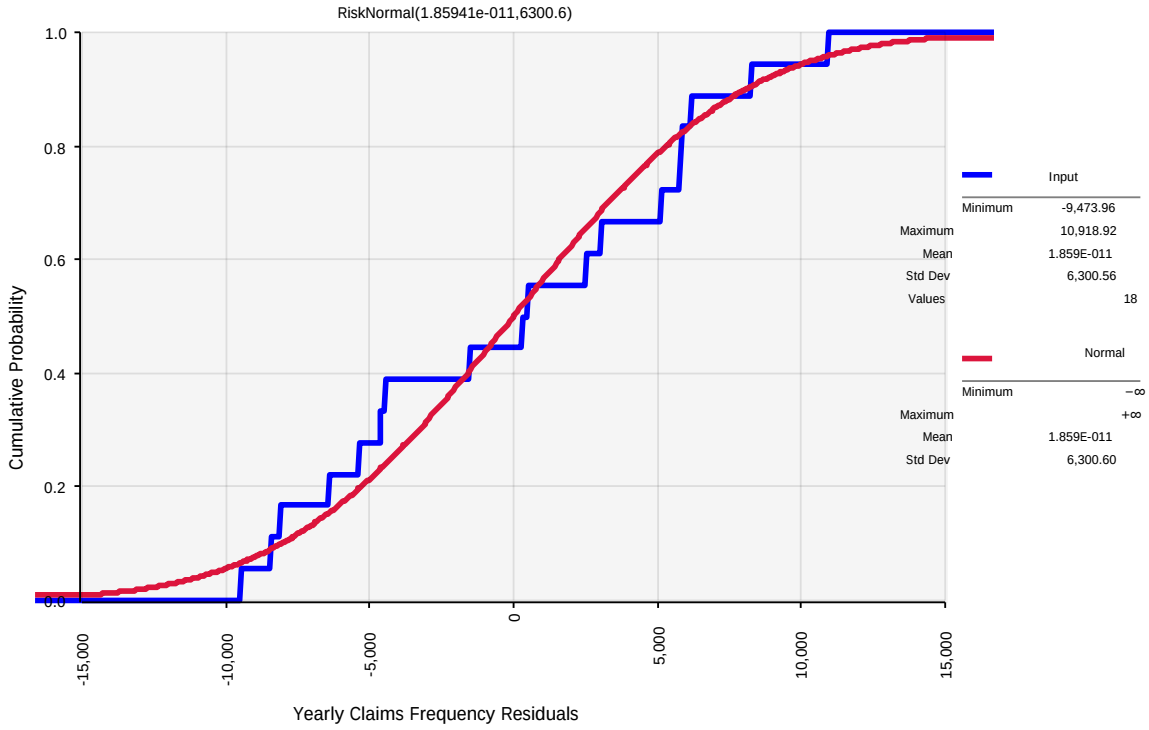
Methodology

Claim Frequency Simulation

Claim frequency was broken down by year to provide the best fit to the true distribution of claim frequencies. Yearly claim frequencies since 2000 were used and adjusted to current levels to provide an accurate estimate of the true number of claims for the given year. These numbers were then used with @RISK[1] statistical software and judgment to select the appropriate distribution for each year that would best represent the data. Actual correlations between coverages were recognized and used in the simulation. For example, the graph below is a fit of the empirical distribution for Collision frequency residuals taken from the regression line.

[1] @RISK is a Microsoft Excel add-on developed by Palisade Corporation to assist in fitting a large number of distributions with large data sets and to simulate numbers generated from these distributions.

Figure DCAT App 6- 1: Fit Comparison for Collision Frequency Residuals



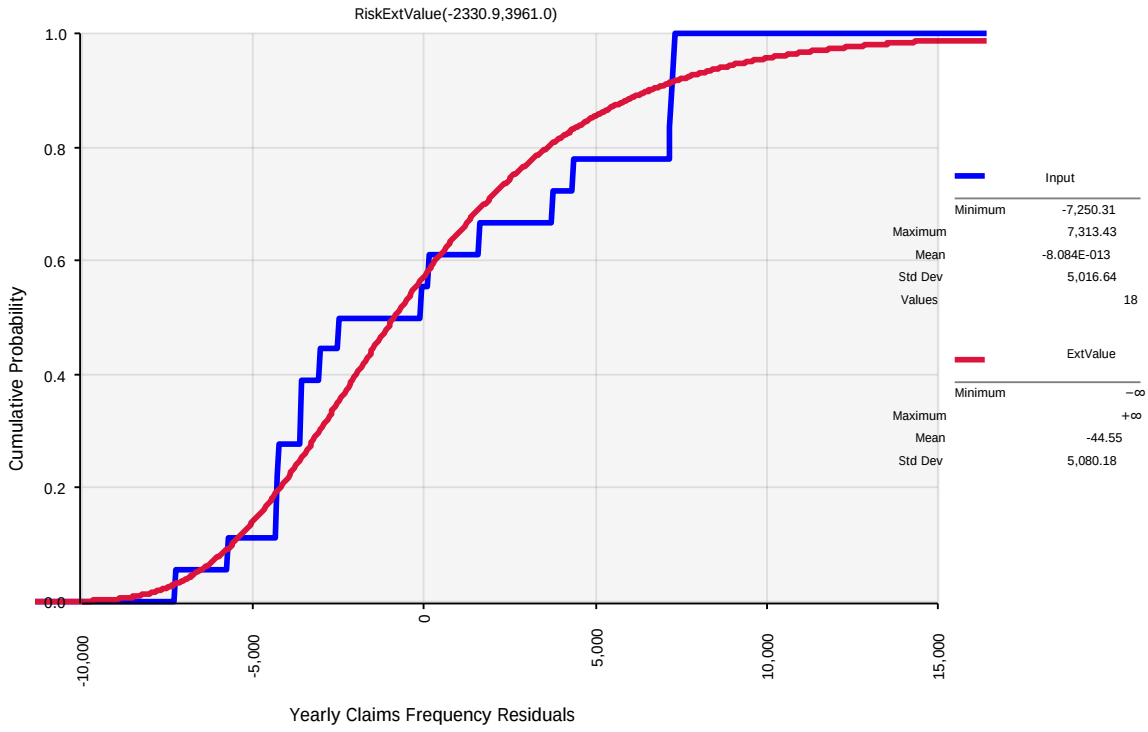
Several discrete distributions were used to fit the data from each year. The best fitting distribution was then selected. In some cases a discretized continuous distribution was needed. To discretize a distribution, the numbers that are generated from the continuous distribution are rounded to the nearest whole number.

The same methodology was used for simulating Comprehensive claim frequency with the following exception:

- Comprehensive claims were split into Hail and Non-Hail categories for simulation purposes.

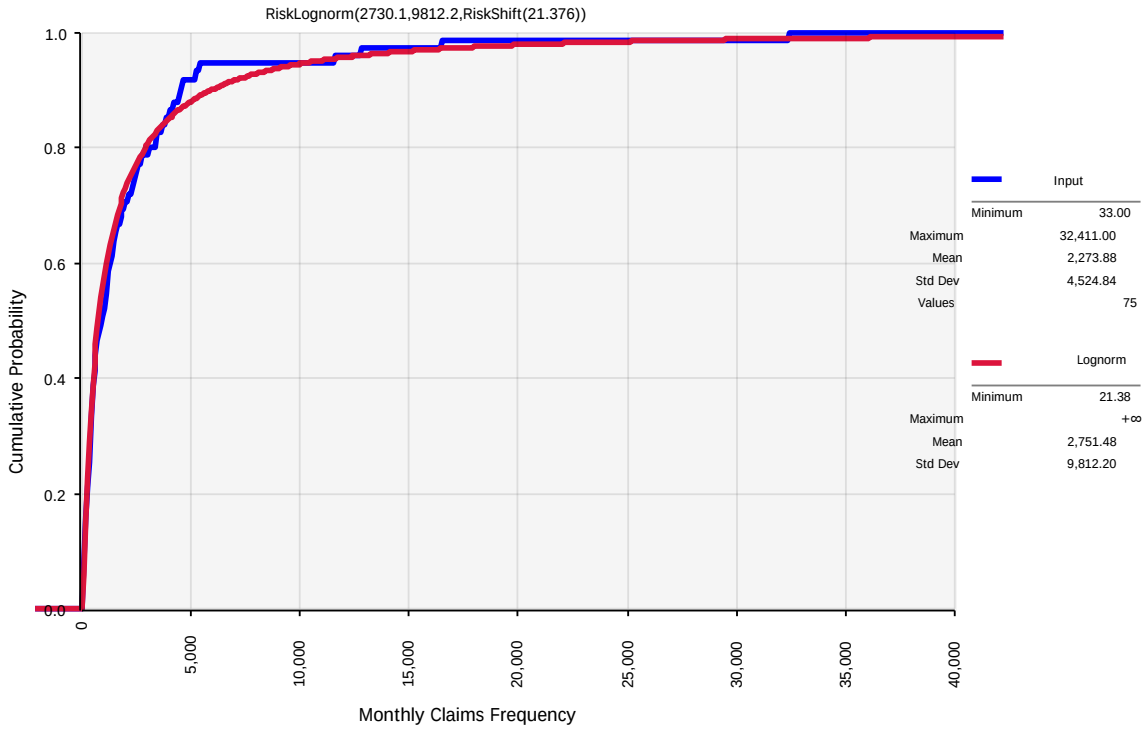
For example, the graph below shows the actual and assumed Non-Hail frequency distribution.

Figure DCAT App 6- 2: Fit Comparison for Comprehensive (Non-Hail) Residuals



For Hail, daily claim frequencies are not practical, so monthly Hail frequencies were used for modeling. For example, the graph below shows the actual versus assumed distribution for Hail claims in the month of June. For Hail frequency we used the last 25 years of data to best represent the variability of Hail. Similar months when combined together provided a better fit than if they were fitted separately. For example, June, July and August all use the same distribution based on June, July, and August actual claim frequency.

Figure DCAT App 6- 3: Fit Comparison for June-August Comprehensive (Hail) Frequency



Claim Severity Simulation

A claim severity model was built to simulate the claim severities of the claims counts. The simulation model splits accident severity into separate coverages: Collision, Property Damage, Hail, Non-Hail, Public Liability, Weekly Indemnity, Accident Benefits Other Indexed and Non-Indexed.

Physical damage severities are very consistent, while injury severities are highly variable. The following table shows the assumed distributions of the coverages at ultimate. The assumed distributions are based on historical data adjusted to current cost levels.

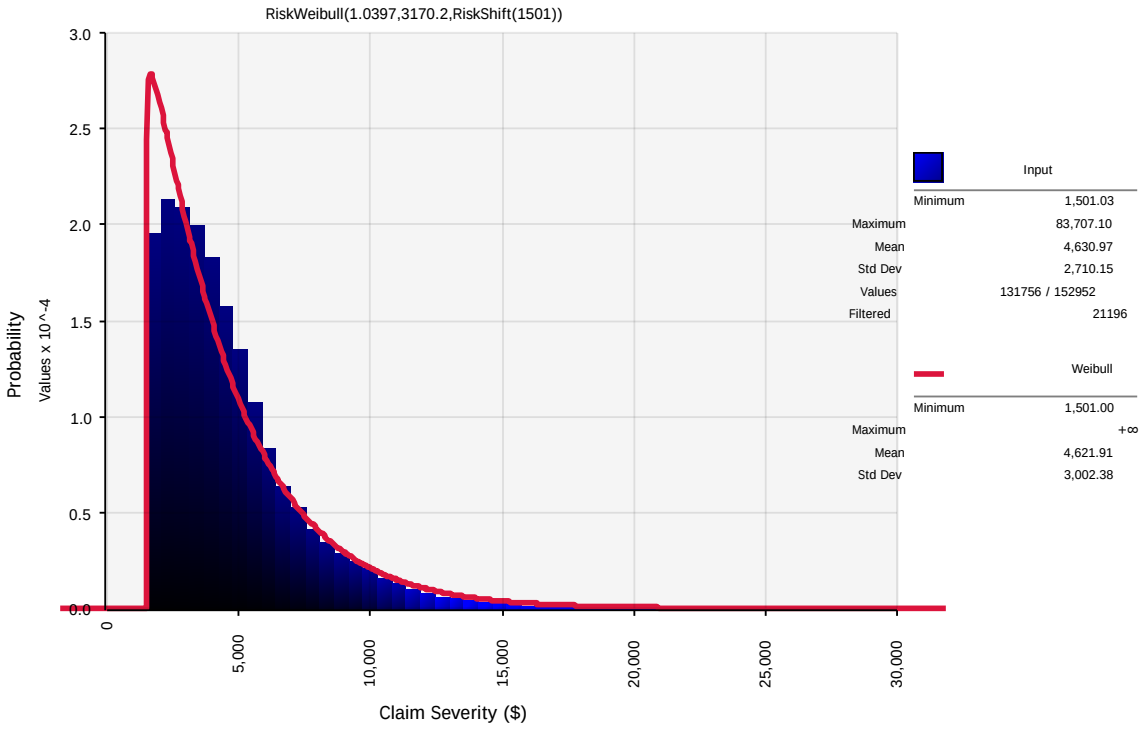
Figure DCAT App 6- 4: Historical Distribution of Claims by Coverage (at Ultimate)

Line No.	Range	Collision	Property Damage	Weekly Indemnity	ABO-Indexed	ABO-NonIndexed	Non-Hail Comp	Public Liability
1	0-10K	92.24%	99.10%	64.38%	94.06%	53.14%	98.13%	44.42%
2	10K-50K	7.73%	0.82%	24.02%	4.84%	37.62%	1.84%	32.34%
3	50K-100K	0.03%	0.05%	4.12%	0.63%	5.87%	0.03%	10.36%
4	100K-250K	0.00%	0.02%	2.84%	0.25%	2.62%	0.00%	10.36%
5	250K-500K	0.00%	0.00%	1.95%	0.12%	0.67%	0.00%	2.40%
6	500K-1M	0.00%	0.00%	2.10%	0.05%	0.07%	0.00%	0.11%
7	1M - 2M	0.00%	0.00%	0.58%	0.02%	0.00%	0.00%	0.00%
8	2M - 3M	0.00%	0.00%	0.01%	0.02%	0.00%	0.00%	0.00%
9	3M - 5M	0.00%	0.00%	0.01%	0.01%	0.00%	0.00%	0.00%
10	Average	$3,895	$1,135	$44,102	$5,347	$21,589	$1,353	$41,443
11	Standard Dev.	$4,586	$3,460	$154,796	$54,064	$41,355	$3,085	$67,803

*The discrete ranges in the above table are used for summarization purposes; the actual severity simulations use continuous distributions.

Severities were simulated on a claim by claim basis. Fitted distributions were used for all claims greater than $1,500 while the empirical distribution was used for claims less than or equal to $1,500. However, in some coverages like Public Liability a different cut off was used to provide a better representation of the distribution of claims. This splitting of the severities was to provide a better fit in the tail of the distribution while still maintaining the average and distribution of the claim severities. For example, the assumed Hail severity distribution is shown below for claims greater than $1,500.

Figure DCAT App 6- 5: Fit Comparison for Comprehensive (Hail) Severity



WEEKLY INDEMNITY

The base forecast and cumulative base forecast for Weekly Indemnity ultimate incurred from 2018/19 to 2022/23 are shown in the table below.

Figure DCAT App 6- 6: Weekly Indemnity Ultimate Incurred – Base Forecast

7	90%	7.3%	5.1%	4.1%	3.5%	3.1%
8	95%	9.5%	6.6%	5.3%	4.5%	4.0%
9	97.5%	11.2%	7.8%	6.3%	5.4%	4.8%

Based on the simulation, single year losses for Collision have a 50% confidence interval of $421.5 million to $455.2 million for 2018/19. After five years, cumulative simulated ultimate losses have a 50% confidence interval of $2,481.5 million to $2,564.5 million. The simulation is skewed to the right as the potential for more severe frequency and severity scenarios is not matched by potential favourable scenarios of the same magnitude.

COMPREHENSIVE

Non-Hail Comprehensive Losses

The base forecast and cumulative base forecast for Non-Hail Comprehensive ultimate incurred from 2018/19 to 2022/23 are shown in the table below.

Figure DCAT App 6- 26: Non-Hail Comprehensive Ultimate Incurred – Base Forecast

9	97.5%	82.3%	70.0%	80.0%	86.7%	91.4%

Compared to gross Hail losses, the net Hail loss distribution has significantly lower upper percentile values. For example, over a five year period the 75th percentile for gross Hail is $341.8 million compared to the 75th percentile for net Hail of $144.8 million.

Over a five year period, the difference between the 25th percentile and the 75th percentile for net Hail losses is about $27.8 million (compared to $157.5 million on a gross basis). Similarly, the percentage deviation from the base forecast between the 25th and 75th percentile is 21.7% (compared to 122.8% on a gross basis).

PROPERTY DAMAGE

The base forecast and cumulative base forecast for Property Damage ultimate incurred from 2018/19 to 2022/23 are shown in the table below.

Figure DCAT App 6- 44: Cumulative Simulated Ultimate Losses % Deviation from Base Forecast – All Basic Coverages

Line No.	Percentile	2018/19	2019/20	2020/21	2021/22	2022/23
1	2.5%	-7.8%	-5.4%	-4.3%	-3.7%	-3.3%
2	5%	-6.5%	-4.5%	-3.6%	-3.1%	-2.7%
3	10%	-5.0%	-3.4%	-2.8%	-2.4%	-2.0%
4	25%	-2.5%	-1.7%	-1.3%	-1.1%	-0.9%
5	50%	0.3%	0.3%	0.3%	0.3%	0.3%
6	75%	3.2%	2.3%	2.0%	1.8%	1.6%
7	90%	5.8%	4.3%	3.5%	3.1%	2.8%
8	95%	7.5%	5.5%	4.5%	4.0%	3.6%
9	97.5%	9.1%	6.7%	5.5%	4.9%	4.4%

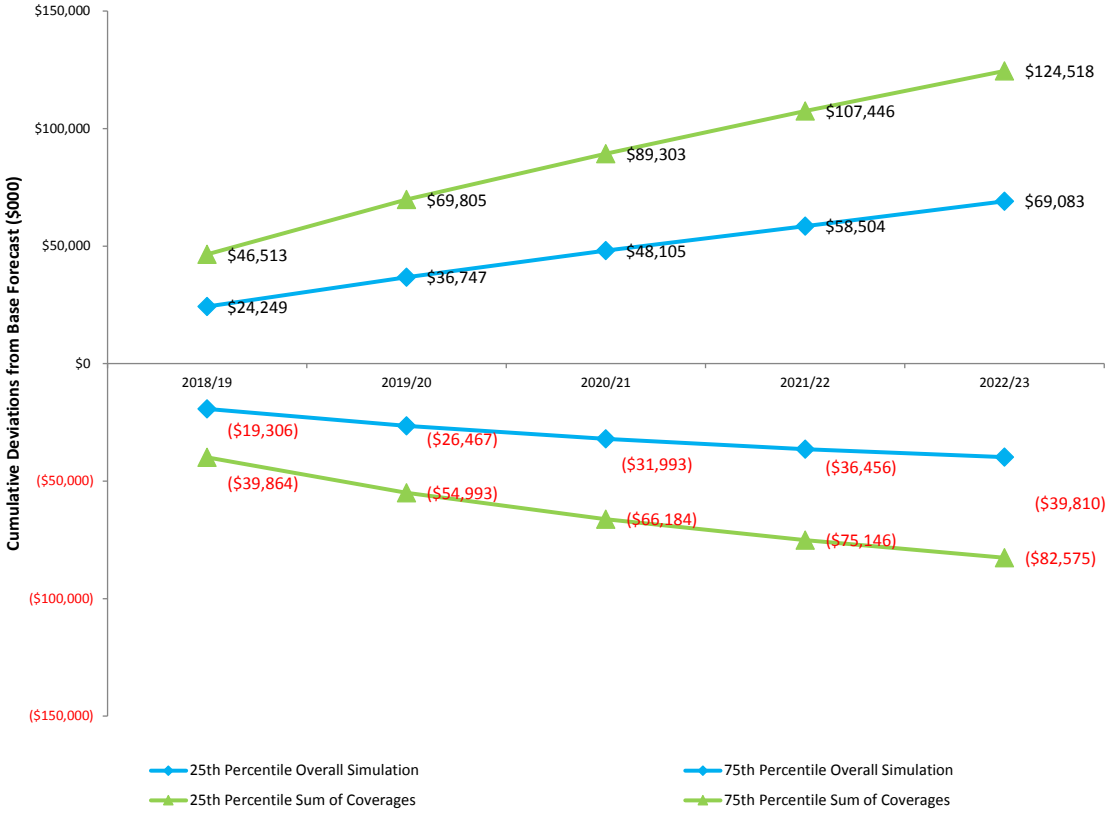
Based on the simulation, single year losses for all Basic coverages have a 50% confidence interval of $749.7 million to $793.2 million in 2018/19. After five years, cumulative simulated ultimate losses have a 50% confidence interval of $4,229.5 million to $4,338.4 million. At an 80% confidence interval, the range over the five year outlook period is approximately +/-$104.3 million or +/-2.3%.

The variability of the overall simulation is significantly less than the sum of the percentiles for the various coverages. Although some of the coverages are positively correlated (e.g. more collisions = more injuries) the correlations are often much less than 1.0 (e.g. an increase in minor winter collisions does not necessarily result in more serious injury claims). Certain coverages are also assumed to be completely

independent (e.g. Hail claims and Collision claims). Similarly, each accident year is assumed to be independent of previous or future accident years, which is why the expected percentage deviations from the base forecast decline over time.

The graph below shows the difference between the variability around the base forecast for the overall simulation (i.e. all coverages combined) compared to the variability around the base forecast if percentiles for each of the coverages were summed up separately.

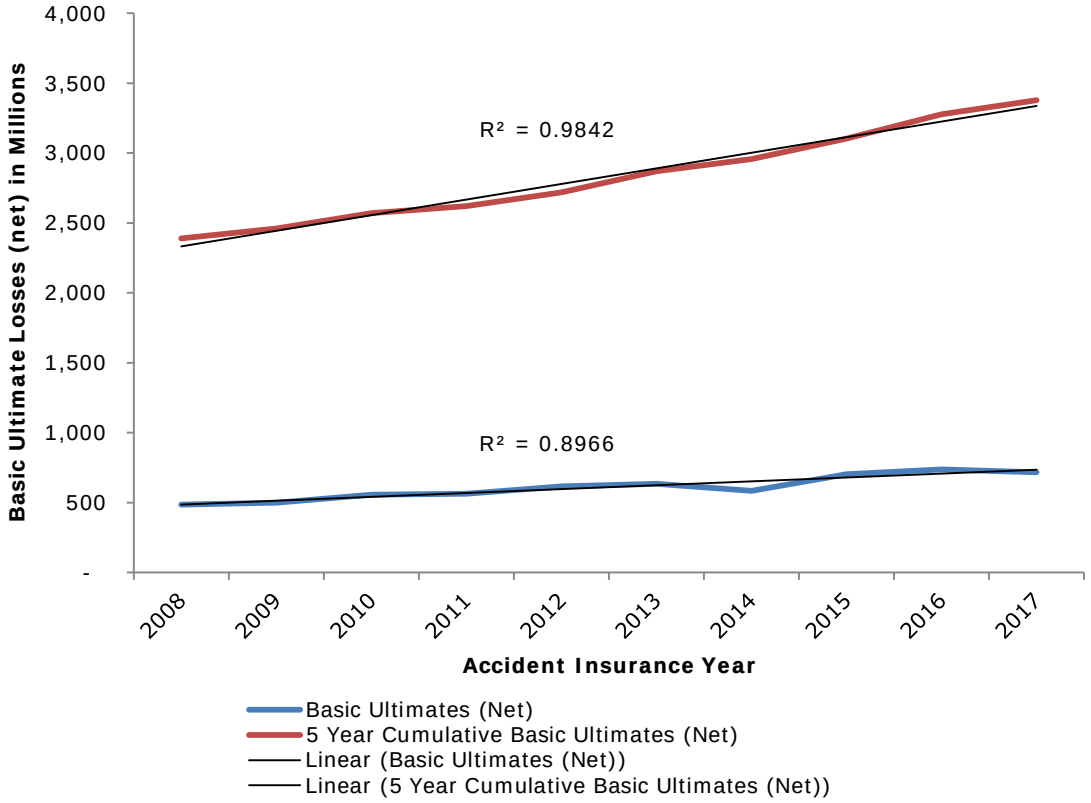
Figure DCAT App 6- 45: Cumulative Deviations from the Base Forecast. Overall Simulation (all coverages) versus Sum of Individual Coverages



The following graph shows the actual variability of the overall Basic ultimate losses net of reinsurance over the past 10 years. The results are shown on a year-to-year basis and a 5-year cumulative ultimate basis. Consistent with the above simulation, overall Basic loss costs (net) are very consistent around the historical trend line (i.e. base

forecast). The variability of results also decreases over multiple years (R^2 of 0.8966 for single year ultimates versus R^2 of 0.9842 for 5-year cumulative).

Figure DCAT App 6- 46: Basic Ultimate Losses (Net) in Millions. 1-year Ultimates versus 5-year Cumulative Ultimates



A percentile comparison of the historical deviations from the trend line (over the past 10 years) relative to the simulation results is shown in the table below. The historical results are very consistent with the actual observed experience around the long term trend line.

Figure DCAT App 6- 47: Comparison of Historical Variability

Line. No.	Percentile	Simulation 1 Year	Historical Variability 1 Year	Simulation 5 Year	Historical Variability 5 Year
1	10%	-5.0%	-3.5%	-2.0%	-1.8%

Purpose of the Report

Manitoba Public Insurance Corporation (hereafter referred to as "MPI" or "the Corporation") is a Crown Corporation. MPI provides basic compulsory automobile insurance to Manitoba motorists. The purpose of this engagement is to conduct an external actuarial review of its Chief Actuary's Dynamic Capital Adequacy Testing ("2017 DCAT") report for Basic Compulsory Automobile Insurance ("Basic") for the fiscal year ending February 28, 2017 in accordance with standards published by the Actuarial Standards Board ("ASB") in Canada. For the purpose of this report, "Basic" is considered as an entity that has its own balance sheet and income statement.

The Corporation engaged J. S. Cheng & Partners Inc. ("JSCP") to conduct the aforementioned external actuarial review. Mr. Joe S. Cheng, a Fellow of the Canadian Institute of Actuaries ("CIA") is the appointed reviewer for this External Review Report.

Relationship with Chief Actuary to Support Objectives

Mr. Joe Cheng, FCIA, is the appointed actuary of MPI but he has no relationship with the Company or the Chief Actuary that would in any way impair objectivity of this review. Additional data requests, initial findings and clarifications were communicated to the Chief Actuary via email correspondence during the course of the review.

Timing of the Report

The DCAT report was released to the reviewer on August 28, 2017.

This document constitutes the External Review Report. Any questions regarding this report should be directed to:

Mr. Joe S. Cheng, F.C.I.A.

ACTUARIES *Who Care*™

Scope of the Report

The scope of this External Review Report includes a review of the Chief Actuary's DCAT Report for Basic Compulsory Automobile Insurance of the Corporation prepared by Mr. Luke Johnston, for the fiscal year ending February 28, 2017. The scope of this report is to:

1. Ascertain that the work of the Chief Actuary is within the range of accepted actuarial practice in Canada, as established by the Actuarial Standards Board (ASB) and the CIA.

2. Review the appropriateness of the assumptions made and the methods employed.

3. Determine whether the DCAT Report accurately describes the assumptions and methodology employed by the Chief Actuary.

4. Review the adequacy of procedures, systems and the work of others relied on by the Chief Actuary. This includes checks on data integrity and checks on procedures and methodologies used to validate the calculations and results.

J. S. CHENG & PARTNERS INC.
JSCP
ACTUARIES Who Care™

Findings And Recommendations

The DCAT report is very comprehensive containing many supporting exhibits. It is easy to follow and many of the assumptions are documented. All findings were reported to Mr. Luke Johnston in correspondence dated September 19, 2017. My major findings and recommendations are:

1. This report introduces a naïve interest rate assumption throughout the forecast period. Previous increasing rate assumptions have proved to be incorrect, compounding forecasting errors. In my opinion, a naïve interest rate assumption is appropriate for the base scenario. Notwithstanding the two recent rate hikes by the Bank of Canada, I do not see any material risk in assuming a naïve interest rate as a base case. My initial guess is an increase in interest rates should strengthen the financial position of Basic.
2. The report concludes that Basic's future financial condition is not satisfactory as total equity does not meet the Public Utility Board's assumed minimum capital target throughout the forecast period in the base scenario. This is due to a 0% profit target, no Rate Stabilization Reserve (RSR) rebuilding fees and approved rate increases lower than indicated rate increases.
3. While the strategy to increase asset allocation in corporate bonds makes economic sense, it is not without risk. The assumption will increase MPI's discount rate and decrease claim liabilities by about $80 million in the short run. However, when the International Financial Reporting Standards (IFRS) 17 is implemented in 2021, the discount rate will no longer be tied to the actual portfolio; it will be a risk-free rate plus a liquidity premium. I think this will result in a drop in discount rate and a substantial increase in claim liabilities unless Government of Canada bond yields increase significantly between now and 2021.

I have no more recommendations or comments.

Consequently, I issued an unqualified opinion of the Peer Review Report.

J. S. CHENG & PARTNERS INC.
JSCP
ACTUARIES *Who Care*™

Opinion

I have reviewed the 2017 DCAT Report for the Basic Compulsory Automobile Insurance of Manitoba Public Insurance Corporation as prepared by the Chief Actuary, Mr. Luke Johnston, in accordance with accepted actuarial standards of practice in Canada.

In my opinion:

1. The work of the Chief Actuary is within the range of accepted actuarial standards of practice in Canada.

2. The assumptions and methods employed are appropriate.

3. The DCAT Report accurately describes the assumptions and methodology employed by the Chief Actuary.

4. The procedures and systems relied on by the Chief Actuary are adequate and sufficient to ensure an appropriate level of data integrity and the accuracy of calculations and results.

Joe S. Cheng, F.C.I.A.

Data and Reliance

In the preparation of this report, I worked with Mr. Raul Martin, FCIA in our office.

In the preparation of this report, we have used the Corporation's annual financial statement and the DCAT Report for the fiscal year ending February 28, 2017 without an independent audit or verification.

Distribution and Use

This report is intended for the Management of the Corporation and its Regulator. Its sole purpose is to provide an external review of the work of the Chief Actuary's DCAT Report for Basic Compulsory Automobile Insurance as at February 28, 2017. This report should be read in conjunction with the aforementioned DCAT Report.

This report may be distributed to any regulator in a jurisdiction where the Corporation operates or intends to obtain a license. Furthermore, the Corporation may distribute this report to its external auditor. Anyone else should be considered as a third party.

This report is neither intended nor necessarily suitable for any other use. Distribution beyond the parties mentioned in paragraph two is permitted provided that prior written consent is given by the Corporation.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. JSCP accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

Third party agrees to keep this report confidential.

ACTUARIES Who Care™

Limitations

In evaluating whether the future financial condition of an insurance enterprise is satisfactory, it is necessary to project future losses, operating expenses and investment income. It is certain that actual future losses, expenses and investment income will not develop exactly as projected and may, in fact, vary significantly from the projections.

Since actuarial estimates are subject to uncertainty with respect to future events, actual results may vary from the amount projected in the Statement of Financial Position. No warranty is expressed or implied that such variance will not occur.

It should be noted that forecasts deal with the inherent uncertainty of future contingent events. While I believe the actuarial projections made by the Chief Actuary represent a reasonable forecast based on the appropriate application of actuarial techniques to the available data, there can be no guarantee that the actual future results will not differ from the forecast stated in the DCAT Report.

My report was limited to a review of assumptions and methodologies underlying the DCAT Report of the Corporation as of February 28, 2017 including any tests of the calculations, as I considered necessary. I did not analyze the validity of any assets used to derive investment income on the income statement.

J. S. CHENG & PARTNERS INC.
JSCP
ACTUARIES Who Care™

Materiality

The standard of materiality is discussed in the DCAT Report. The Chief Actuary has selected a standard of materiality of $10 million based on 2 times the Basic Appointed Actuary's Report materiality and the greater uncertainty associated with the DCAT projections. I believe this is a reasonable selection.

Definition of Satisfactory Future Financial Condition

Basic total equity, net of any special appropriations is referred to as the Rate Stabilization Reserve (RSR). For the purpose of this report, Basic total equity and RSR are used interchangeably because there are no special appropriations currently. The Public Utilities Board (PUB) in Manitoba sets the minimum and maximum RSR targets (capital targets) for the Corporation.

The PUB currently uses the DCAT analysis at a 1-in-40 year probability level with management action to determine the minimum capital target, but no methodology has been approved for the maximum capital target after Order 162/16 was released.

The Corporation has a satisfactory future financial condition if:

1. Under the base scenario, the insurer meets the Manitoba Public Utilities Board's minimum Rate Stabilization Reserve (RSR) target.
2. Under the base scenario and all plausible adverse scenarios, the statement value of the insurer's assets is greater than the statement value of its liabilities.

J. S. CHENG & PARTNERS INC.
JSCP
ACTUARIES Who Care™

Base Scenario

The base scenario assumptions are documented in supporting exhibits that are part of the DCAT Report. The base scenario reflects a $27.8 million capital transfer from its Extension line of business to Basic at the end of the 2016/2017 fiscal year and the Corporation's filed rate increase of 2.7% in 2018/2019. The Corporation's base scenario is consistent with its experience and is reasonable. However, in the base scenario, the total equity does not meet the Public Utility Board's minimum capital target in all forecast years.

Adverse Scenarios

The DCAT Report identifies four scenarios posing the greatest risk to satisfactory financial condition. The one- to four-year cumulative impacts were reviewed for each of the 99.5th, 99th, 97.5th and 95th percentile (1-in-200, 1-in-100, 1-in-40 and 1-in-20 year respectively) events before selecting the highest equity impact (one, two, three or four year scenarios) at the 97.5th percentile as the testing event. This year's report ranks the scenarios based on total equity (same as last report). In addition, the report indicates that there are no scenarios (after management action) at the testing level (97.5th percentile) that would cause the Corporation's total equity to fall below zero. The four scenarios identified as posing the greatest risk to satisfactory financial condition are:

1. **Decline in Equity Markets**

   This scenario tests a decline in the one-to-four year equity valuations based on the historical S&P/TSX returns by percentile and return period. Dividend yields remain the same as the base scenario, however, are applied to a reduced market value. It is assumed that 20% of the unrealized losses are realized each year (same assumption as last year). If the market value remains below 100% of the book value for a period of longer than a year, then at the following fiscal year-end, an impairment is recognized (same assumption as last year). The U.S. equity portfolio is also subject to the same impairment rules. The largest decline (at 97.5th percentile level) in total equity is $150 million in 2020/21 for the three-year scenario which is a combination of increases in realized losses (investment income) and unrealized losses (accumulated other comprehensive income). This scenario is reasonable.

J. S. CHENG & PARTNERS INC.
JSCP
ACTUARIES Who Care™

2. Combined Scenario (Interest Rate, Equity Decline and High Loss Ratio)

This scenario assumes a naive interest rate environment will continue throughout the forecast period (new assumption this year) and Basic experiences adverse equity and claims experience. Equity returns are assumed to have no correlation with interest rates. Undiscounted claim costs are assumed to be independent of interest rates and equity returns. A floor is applied to ensure interest rates do not fall below 1.00% (down from 1.02% last year). The selected four-year scenario at the 97.5th percentile level reduces total equity $275 million in 2021/22 when compared to the base scenario. The reduction of interest rates increases claim reserves estimates through a reduction in discount rate. This scenario is reasonable.

3. High Loss Ratio Scenario

This year's scenario adjusted severity and frequency parameters by coverage to better match the simulated median with the forecasted values. The largest impact on equity is the four year scenarios. At the 97.5th percentile level, the increase in claim costs reduced total equity by $181 million over the forecast period when compared to the base scenario. Claim frequencies and claim severities were simulated with actual correlations between coverages recognized in the simulation. The estimated impact of premium deficiency or write-down of deferred policy acquisition costs was included in the simulated results. This scenario is reasonable.

4. Interest Rate Decline Scenario

The base forecast incorporates naive interest rate forecast (new assumption this year). This scenario assumes a sustained decline in interest rates by modeling historical changes in interest rates over 1,2,3 and 4 years. The largest decline (at 97.5th percentile level) in total equity is $82 million in 2021/22 for the four-year scenario. The reduction of interest rates increases claims liabilities through a reduction in MPI's discount rate. A floor is applied to ensure interest rates do not fall below 1.00% (down from 1.02% last year). This scenario is reasonable.

The methodology and assumptions employed by the Chief Actuary are appropriate.

J. S. CHENG & PARTNERS INC.
JSCP
ACTUARIES Who Care™

Description Of Assumptions And Methodology

The DCAT Report accurately describes the assumptions and methodology employed by the Chief Actuary.

DCAT Model

The DCAT Report relies on a model to do the required DCAT investigation. The model is very detailed. The scope of my work excludes a detailed validation of the financial model. However, I did some testing of the model and believe the model is producing reasonable results.

Adequacy Of Procedures, Systems And The Work Of Others Relied On By The Chief Actuary

I have detected no material issues to be reported on.

Conclusion

The report is prepared in accordance with accepted actuarial standards of practice in Canada, as established by the ASB.

RISK MANAGEMENT FRAMEWORK

2019 GENERAL RATE APPLICATION

June 15, 2018

Manitoba Public Insurance

RISK MANAGEMENT FRAMEWORK

MPI is in the process of developing a new Enterprise Risk Management Framework, which will be filed in the 2020 General Rate Application. The Corporation's Audit, Finance and Risk Committee determined that the discussions and decisions on the future form of an Enterprise Risk Management framework would be deferred until such time as the new Chief Executive Officer (Ben Graham) assumes his post, and has had opportunity to discuss with the Audit Committee Chair and Chief Financial Officer.

On May 1, 2018, Luke Johnston was appointed to the position of Chief Actuary and Vice President, Actuarial and Risk Management. This position reports to the CEO, but also has a matrix reporting line to the Audit, Finance, and Risk Committee. The new division will bring together Actuarial, Investments, Financial Forecasting, Risk Management, Product (Insurance and Underwriting), and oversight of the PIPP Centralized Reserving Process into a single division. The development of the Enterprise Risk Management Framework, in conjunction with the CEO and the MPI Board, is a key corporate priority for the Actuarial and Risk Management division in fiscal 2018/19.

Although MPI does not currently have a formal and holistic Enterprise Risk Management Framework in place, risk management functions are applied throughout the Corporation in various forms. However, these existing functions are at various stages of development. The Risk Management Framework will fully develop, document, and embed a centralized risk management operation and oversight in the Corporation. MPI's existing risk management functions include, but are not limited to, the following risk categories:

- Strategic (e.g. political changes, societal trends, competition, corporate direction)
- Business Interruption (e.g. business continuity management, disaster recovery, hazard specific)
- Information Technology (e.g. privacy, access, emerging technologies, information security)

- Compliance (e.g. agreements, contracts, legislation, regulations, professional standards, governance)
- Legal (e.g. reviewing procurement agreements, assessing litigation risk including corporate exposure on insurance defence files and bodily injury appeals)
- Claims Control (e.g. trend analytics, reinsurance, Special Investigations Unit, climate change)
- Capital Management (e.g. Dynamic Capital Adequacy Testing, MCT)
- Investments / Market (e.g. Asset and Liability Management program)
- Other Financial Risks (e.g. corporate insurance, auditing, credit rating)
- Workplace Resilience (e.g. safety, health, physical security)
- Stakeholder Relations (e.g. tracking public / stakeholder support)
- Workforce Management (e.g. wellness, retention, succession planning, labour interruption)
- Reputational (e.g. media relations, Crisis Communications Team)
- Project (e.g. planning, schedule, quality, risk register integration)

The focus in the next 6-12 months will be to develop the framework that clearly articulates the appetite for risks across the organization with greater emphasis on the quantification of those risks for which we are exposed through frequency and/or severity of each event. This framework will be approved by the Board of Directors and be led and owned by the senior management of MPI.

LOSS PREVENTION

In PUB Order 130/17 dated December 4, 2017, the Board found that, for the purposes of future GRAs, road safety and loss prevention would be best addressed by devoting a Technical Conference to the many issues involved in reviewing road safety and loss prevention. Further, as the legalization of the recreational use of cannabis is anticipated in the summer of 2018, following the anticipated filing of the 2019 GRA, the Board expects that the Technical Conference will take place in early 2019, so that the information generated from the Technical Conference can be filed in the 2020 GRA. As such, the issue of road safety will not need to be reviewed in the same level of detail in the 2019 GRA as it was in the 2018 GRA.

Manitoba Public Insurance was ordered to do the following with respect to Loss Prevention and Road Safety:

11.22 MPI shall enter into discussions with Coalition of Manitoba Motorcycle Groups (CMMG) regarding a proposal for a pilot program for wildlife collision prevention initiatives and shall advise the Board of the discussions as they develop.

11.23 A Technical Conference shall be held on road safety and loss prevention in early 2019, which shall be initiated by the Board but on such dates as are mutually agreed as between the Board and MPI. Included within the Technical Conference shall be the following:

- Progress on the implementation of the Loss Prevention Strategy and Framework;
- Reports on the activities of the External Stakeholder Committee on Loss Prevention and the Provincial Road Safety Committee;
- Progress on the 2017-2020 Road Safety Operational Plan;
- Progress on the Provincial Road Safety Plan - Road to Zero;
- Reports on MPI's priorities for road safety and loss prevention;

- Reports on the success of the Drug Impaired Driving Communication Strategy and any other efforts undertaken by MPI to address drug-impaired driving;
- Reports on MPI's efforts to address speed and distracted driving;
- Progress on the High School Driver Education Program Redevelopment;
- An update on MPI's rural road strategy;
- A discussion / review of the incorporation of the social costs of collisions in MPI's road safety efforts;
- An effort to obtain feedback from members of the External Stakeholder Committee on Loss Prevention on the effectiveness of that committee; and
- A jurisdictional scan conducted by the Corporation of road safety measures, including wildlife collision prevention initiatives.

In PUB Order 11/18, dated January 15, 2018, the PUB further ordered that:

6.13 Included among the issues to be examined in the 2019 Road Safety Technical Conference directed in Order 130/17 shall be:

6.13.1 Safety for drivers and clients of Vehicles For Hire (VFH);

6.13.2 Safety and training standards for all VFH drivers; and

6.13.3 Safety issues relating to persons with disabilities and VFH.

6.14 The road safety information filed by the Corporation in the 2019 GRA include information regarding emerging road safety issues as a result of the introduction of Transportation Network Companies in Manitoba.

The Corporation welcomes the opportunity to have a robust exchange on the issues, initiatives, plans, strategies, and programming developments at the Technical Conference and will defer all discussion on these matters to that venue in early 2019. In addition to the information identified in the Order above, the Corporation also

intends to make available the following information to the PUB and intervenors at the Technical Conference:

- All fatality and injury statistics that have been provided in previous GRAs;
- Collision maps for Winnipeg and Brandon for pedestrian, cyclist, and motorcyclist collisions;
- Information on new programming initiatives planned for the 2019 fiscal year and the outcomes of pilot evaluations and research initiatives; and
- Updates on partnership initiatives, including enhanced enforcement.

It is also the intent of the Corporation to leverage the ongoing meetings of the External Stakeholder Committee on Loss Prevention in the interim to share information on matters of mutual interest, continue discussion on loss prevention issues and approaches, and hear presentations and/or receive the viewpoint of stakeholders to inform decision making on loss prevention and road safety priorities and programming. The Corporation will also continue to be an active participant on the Provincial Road Safety Committee as it works to identify specific strategies and initiatives to address the priority areas identified in the *Road to Zero: Manitoba Road Safety Plan* 2017-2020.

For the 2019 GRA filing, in addition to providing the information ordered by the PUB, the Corporation has included the emergent strategy developed in response to Order 11.22. The road safety financial summary is provided in *Part V(i) Expenses Appendix 15,* as well as new loss prevention program and activity highlights and developments that may be of interest to the Board in advance of the 2019 Technical Conference.

LP.1 LOSS PREVENTION AT MANITOBA PUBLIC INSURANCE

MPI maintains the view that loss prevention programs and activities contribute to safer roads, fewer claims, and lower claims costs. The commitment to loss prevention is realized through key strategies and operational plans that prioritize investment to address the primary causes of loss, and employs tactics and measures that are proven (or promising) in the national and international communities of practice to raise awareness, alter belief and behaviour, and/or reduce loss – both human and financial. Efforts are driven by evidence and evaluated for their effectiveness in achieving stated objectives.

In short, the Corporation's structural foundation for loss prevention is divided into two central themes:

1. Prevent collisions and claims from ever occurring (discretionary and regulatory activities to promote and/or ensure safety on the road and prevent auto theft), and

2. Reduce the cost of those collisions and claims if they do occur (activities that reduce claims cost and leakage).

The Corporation also has a role within the provincial Safe Systems model to support the shared vision for safe roads, safe vehicles, safe speeds and safe road users. MPI co-chairs the Provincial Road Safety Committee and has committed to the priorities established to advance the *Road to Zero: Provincial Road Safety Plan 2017-2020* which includes the gradual downward trend toward zero injuries and death on our roadways (Toward Zero approach).

LP.2 LOSS PREVENTION HIGHLIGHTS

Acknowledging that loss prevention programming will be discussed in detail at the 2019 Technical Conference, MPI wishes to highlight key program and business initiatives that have either launched since the 2018 GRA or will launch prior to the 2019 Technical Conference for information.

LP.2.1 Driver Safety Programs

MPI continues to progress on its Operational Plan for Road Safety 2017-2020 (filed in the 2018 GRA) and the Loss Prevention Strategy. The Operational Plan continues to establish the priorities, produce concepts for development, and evaluate existing program portfolios to refine and enhance existing interventions or provide evidence to support new initiatives. Evaluation also identifies programming that no longer serves to advance and achieve the Corporation's road safety agenda.

LP.2.1.1 Driver Testing

The Driver Testing program has implemented a new knowledge test application, providing an improved customer experience and better data to help MPI understand and address the strength and weakness of testing candidates which will be used to inform the question set in 2018/19. As suggested in the Loss Prevention Strategy, MPI is now leveraging data from the knowledge test application to understand potential education and training gaps within the High School Driver Education Program. This information is deployed in the curriculum redevelopment efforts currently underway in the High School Driver Education Redevelopment Project.

LP.2.1.2 Traffic Safety Culture

MPI will launch a new and innovative traffic safety culture campaign in Fall 2018 which will introduce Manitobans to a new vision for road safety and a call to shared action

and responsibility in eliminating human injury and death on Manitoba roads. The campaign will appeal to Manitobans to:

1. See and acknowledge the problem of road fatalities in our province

2. Understand that each person is important, has a story, and can be saved; and

3. Make a personal change to become active ambassadors, rather than passive observers, in our transportation system to reduce human toll.

This major campaign, which includes a wide range of media platforms, will set the foundation, tone, and unifying call to action for future segmented road safety awareness efforts which will provide targeted and meaningful messages to different demographic audiences at risk for various unsafe behaviours, using media and communication styles that are most likely to reach and influence them. This initiative represents a fundamental component of the *Road to Zero: Manitoba Road Safety Plan*, which provides a vision for our provincial culture with respect to safe roads, safe speeds, safe vehicles and safe road users.

LP.2.1.3 Driver Assistive Technology - Consumer Awareness

MPI has initiated a new campaign to raise consumer awareness about the benefits of driver assistive technology as tools in collision avoidance. Micro-ads on social media platforms, supported by detailed information on MPI's website will help Manitobans understand what driver assistive technologies are available, how they work, and how drivers can benefit from their use. Driver assist technologies showcased include: forward collision avoidance and emergency braking, blind spot detection, lane departure warning and lane keeping assist, adaptive cruise control, back-up cameras/warnings, adaptive headlights, and electronic stability control systems. These technologies are increasingly proving to reduce injury and property damage claims, as reported by the Insurance Institute for Highway Safety / Highway Loss Data Institute. In addition to MPI's objective to reduce human error-related claims and

claims costs, this campaign also supports the provincial *Road to Zero* priority to escalate adoption of these technologies to reduce human injuries and fatalities.

LP.2.1.4 Forward Collision Warning Pilot for Taxis

Beginning in summer 2018, the Corporation will commence an aftermarket forward collision warning pilot program with Winnipeg taxicab companies. This pilot program is a result of ongoing collaboration with the taxi cab industry to pursue strategies to improve loss experience, which drives claims costs and the premiums charged to taxi cab owners to cover these claims costs.

The Corporation will equip 100 taxis with aftermarket forward collision warning technology, which has been shown to be effective in reducing overall claims experiences in other fleets, and is particularly effective at reducing rear end collisions.

The program pilot will last for one year, and will compare claims frequency and costs of taxis that have the technology installed, against those that do not. The pilot program will also compare the claims experience of the taxis with the technology against their previous claims experience prior to the system installation.

LP.2.1.5 Drugs and Driving

MPI continues to execute against its comprehensive public awareness and education campaign to address the dangers and consequences of drug-impaired driving in anticipation of the legalization of recreational use of cannabis in 2018. Targeted audiences include young novice drivers and their parents (via the High School Driver Education program), youth in general, the general population, and physicians and patients who are prescribed cannabis for medical conditions. The campaign strategy (filed with the 2018 GRA) is focused on informing Manitobans about how cannabis can affect driving ability, correcting misperceptions about cannabis and driving and putting Manitobans in a position to make informed choices about driving after consuming cannabis once it becomes more readily accessible.

A component of MPI's broader drug-impaired awareness strategy focuses on use of a range of prescription medications and raising awareness about the extent to which these can impair driving. MPI is partnering with a researcher in the Department of Medicine and Community Health Sciences at Seven Oaks General Hospital on a project that will combine health and claims data to link prescription opioid use as a risk factor in motor vehicle injuries. The research intends to determine if drivers with an active prescription for opioids analgesics are at an increased risk of being involved in a motor vehicle collision associated with injury, and if the risk varies with dosage and duration of treatment.

LP.2.1.6 Auto Theft

MPI is working with the province to address emerging trends in auto theft, recognizing that program solutions for this issue must evolve with the changing modus operandi of vehicle thieves. Past programming focused on solving the auto theft problem in vulnerable vehicles with after-market immobilizers. Currently 99 percent of most at risk older vehicles are now immobilized and all new vehicles manufactured since 2007 are equipped with factory immobilizers. Despite this, vehicle theft persists and thieves are using vehicle keys to commit their crime. Future efforts to reduce theft will focus on vehicle owners and their need to protect their keys.

LP.2.2 Vehicular Programs

The new research and training centre located in the J.W. Zacharias Physical Damage Research Centre opened in October 2017, which will enable qualified technicians to work in collaboration with Manitoba's repair industry as it adapts repair methods related to vehicles now being constructed of complex materials, including aluminum, carbon fiber, high strength and ultra-high strength steels. Training and research centre technicians work closely with Manitoba's repair industry and Red River College to offer access to training on new and emerging vehicle repair techniques and equipment, resulting in significant savings for local collision repair shops. A highly skilled repair industry in Manitoba will also reduce costs to MPI in the long term by

ensuring repairs can occur in the province and vehicles are repaired safely back to manufacturer standards.

LP.2.3 Loss Cost Reduction Programs

The Special Investigations Unit operationalized the use of predictive analytics into claims triage and investigation operations, flagging potential fraudulent claims at first notice of loss. Predictive analytics uses techniques including data mining and modeling to analyze current data to make predictions about fraudulent claims. This has enabled stronger investigation referrals, a higher success rate, and shorter investigation time cycles. Predictive analytics is projected to increase fraud detection and savings to the Corporation, beginning in fiscal 2018.

LP.3 BOARD ORDER 11.22

MPI, with the consent and support of CMMG, entered into discussions with all Loss Prevention stakeholders on the issue of wildlife collision prevention initiatives, given the broader interest in reducing the costs associated with these claims. The External Stakeholder Committee on Loss Prevention quarterly meeting in February 2018 was utilized as a forum to share current collision and claim statistics, highlight previous research completed by MPI, share best practices in wildlife collision mitigation tactics, discuss promising technology and public perceptions of it, and MPI's current approach to address the issue.

Stakeholders provided written and verbal feedback which was then incorporated into a draft *Proposed Strategy for Collisions with Animals – Programming and Research* (2018-2019). The strategy was subsequently provided to CMMG for review and feedback and an individual consultation between MPI and CMMG was held in April 2018. CMMG provided written comments and suggestions which have been considered and, where deemed appropriate by MPI, incorporated into the strategy document. Please refer to Appendix 1 for the draft strategy document.

LP.4 BOARD ORDER 6.14

The Board has ordered that MPI provide with this filing, information regarding emerging road safety issues as a result of the introduction of Transportation Network Companies (TNCs) in Manitoba. It should be noted that current legislation delegates authority over TNCs to the municipalities; therefore, MPI is reporting on information as per the City of Winnipeg's bylaw. Under this legislation these safety considerations are not the responsibility of MPI; however, the Corporation is consulted and actively provides input where there is opportunity to do so.

The availability of convenient and reliable transportation options can contribute to safer decisions and outcomes for all. Expanding vehicles for hire provides more options for people who should not drive and makes this option more attractive than less safe alternatives. It is anticipated that the instances of impaired driving will decline as a result of the introduction of transportation network companies (all else remaining the same).

Driver and passenger safety considerations that have been addressed or may be emergent in future include the following issues. This is not considered an exhaustive listing at present, and MPI will continue to monitor and respond to issues as they come to light in the new vehicle for hire environment.

1. **Vehicle condition (mechanical) and empowering passengers through transparency and accountability when they request or provide a ride**

   With The Local Vehicles for Hire Act now in force, Winnipeg and other municipalities are responsible for ensuring Vehicles for Hire are safe to operate through their municipal by-laws. For example, Winnipeg's Vehicle for Hire By-law requires that TNC vehicles be inspected within 30 days of being registered with a licensed dispatcher, and that vehicle inspections are conducted on an annual basis thereafter. Driver criteria and screening including historical information regarding criminal driving infractions and operator's fitness to drive.

The Local Vehicles for Hire Act also allows municipalities to establish requirements for the character and fitness of TNC drivers. For example, Winnipeg's Vehicle for Hire By-law requires that TNC drivers hold a valid driver's licence applicable to the vehicle being driven; and in addition to providing driver background checks (a full driver's abstract containing any information regarding traffic collisions or driving infractions), they must also provide mandatory criminal record and vulnerable sector checks. A TNC operating in Winnipeg would not be able to register a driver charged with a criminal code offence or major driving infractions within the past 10 years.

2. Information disclosure to ensure identification, permits or licences are on display or available to passengers

The Local Vehicles for Hire Act also allows municipalities to establish requirements for the collection and provision of information. Winnipeg's Vehicle for Hire By-law requires that TNC companies provide the following driver and vehicle information through the TNC app (or digital platform used to dispatch the vehicle) to the customer: driver and vehicle information (e.g., driver name and photo, vehicle make, model, and estimated time of arrival of the vehicle providing the ride service); complaint mechanisms for driver and passenger rating; and electronic receipts which provide details regarding the fare paid. Further, drivers for TNC companies are not permitted to solicit or accept street hails as all transactions must be initiated and completed through the TNC app.

3. Proper use of occupant restraints, particularly passengers

The use of occupant restraints is mandatory in Manitoba. However, as permitted by regulation, a driver of a taxicab is exempt from this requirement and far too often taxi passengers follow suit. TNC drivers would be more accustomed to wearing their seatbelt, and as a result, would likely see greater occupant restraint use with passengers.

MPI is currently working with the taxi industry to refresh decaling in the passenger cabin to alert passengers of their legal requirement to wear a seatbelt. Options are under consideration to expand this initiative to vehicles of TNCs, recognizing the issue of failing to use occupant restraints in taxi cabs is likely to also be demonstrated by some users of vehicles for hire. Raising public awareness is a critical step in shaping the behaviour of the ride hailing public.

LP.5 CLOSING REMARKS FOR THE LOSS PREVENTION CHAPTER

MPI maintains its commitment and progressive effort to ensure that loss prevention programming and activities are grounded in evidence and demonstrate value to Manitoba rate payers. The Corporation is increasingly leveraging data and analytics to find new opportunities and maximize benefits that can be realized through new interventions. MPI will continue to invest when proven or promising initiatives can contribute to a reduction in collisions or claims costs. In addition, the Corporation is actively engaged with the province and external stakeholders to seek opportunities to improve road safety outcomes for all Manitobans.

EXECUTIVE SUMMARY

Collisions with wildlife continue to be a very frequent contributing factor for claims in Manitoba and are widespread. The following pages provide the proposed strategy of Manitoba Public Insurance (MPI or the Corporation) for addressing this challenging issue for this fiscal year, 2018-2019. This strategy document provides a brief review of key collision statistics, identifies potential mitigation techniques and what we have learned, and recommends specific action items.

MPI's strategy also follows a consultation with external stakeholders, who it invited to provide comments and ideas for future initiatives. The results of that consultation are enclosed in Appendix 1 of this document. The Corporation wishes to thank the members for their interest and attention to this task.

In summary:

- Collisions with animals continue to be high, and are largely dependent on animal populations (mortality rate in the face of severe or mild winters) and on the relative volume of traffic as drivers commute farther and transport goods on new highways. Even the price of gas, and the corresponding reduction in vehicle volume, can impact collisions.
- Highly effective mitigation tools are extremely expensive. Areas assessed in MPI cost-benefit analyses have many access points or gaps to address (adding cost to fencing) and would simply move the collision sites to the end of the fencing; some of these areas are too hilly to allow for active detection systems.
- External stakeholder committee members recognize the impact of speed on a driver's ability to stop for an animal. The suggestion for seasonal variable speed limits, while effective for hazardous road conditions, are not likely appropriate for wildlife in Manitoba as they are not consistently visible. Further, while public awareness campaigns will continue to raise awareness of speed as a factor in collisions with wildlife, enforcement of the law can be difficult.
- Awareness and education encourages drivers to slow down and reminds them what to look for and how to stay in control, and will increasingly emphasize focus on the road.
- Seasonal roadside signs fall within the category of being modestly effective. They do improve awareness in higher collision areas and reduce speed slightly; however, evaluations are seldom conclusive given fluctuations of wildlife populations. MPI will continue to support Variable Message Signs (VMS), but our suggested approach (for better cost efficiency) is to purchase, as opposed to rent them, on behalf of one partner this year. MPI also proposes to shift budget in 2018 to test a less costly option – programmable LED lights on select crossing signs.
- Finally, emerging vehicle technology is very promising, and may lead to reductions in the number and severity of collisions. MPI will continue to monitor advancements in emerging vehicle safety technology and promote their use as they become more mainstream.

(PAGE LEFT BLANK INTENTIONALLY FOR DOUBLE-SIDED PRINTING)

A. BACKGROUND:

1. Collision Statistics

A large proportion of the many collisions with animals processed by MPI involves deer (about two-thirds). Deer are widely dispersed across Manitoba, as our roads intersect their habitat. Collisions with deer (avg. 6,000+/year, 2012-2016) occur mostly on rural roads but also alongside urban green spaces.

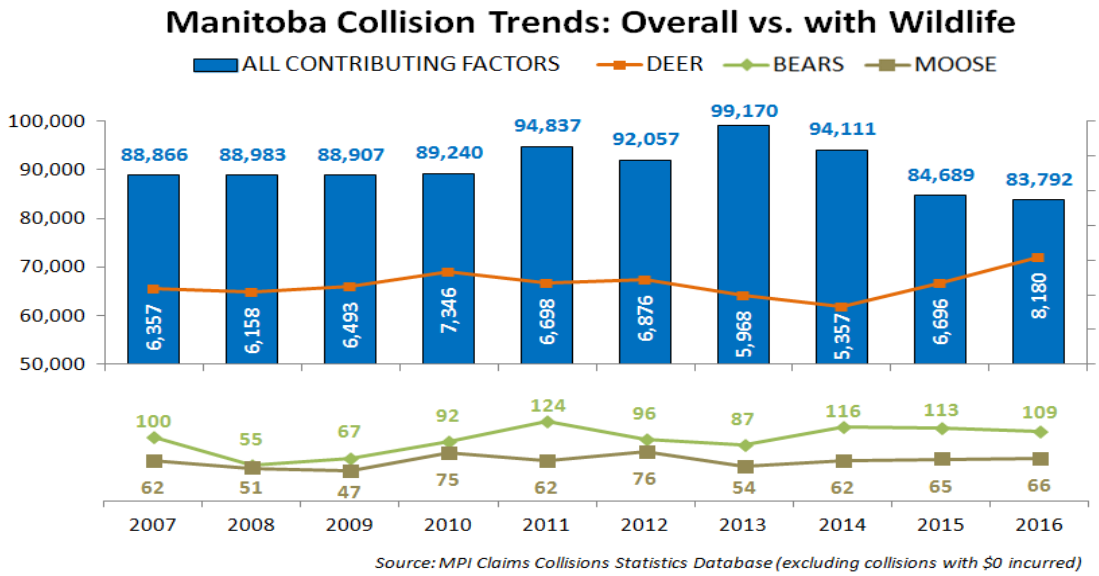
Collisions with moose are relatively few in Manitoba (~60 per year) but are a concern in some areas as risk of fatality can be high to passengers. Collisions with bears (~100 per year) also cause significant vehicle damage but crashes with moose are more dangerous to passengers.

Collisions with animals are classified as an environmental factor and are difficult to avoid. However, driver preparation is critical, as slight adjustments in driving behaviour can prevent a more severe crash, if not avoid it altogether. This includes being extra alert during peak times in known crossing areas, driving slower to allow more time to stop, and avoiding swerving for animals.

Collisions with animals may fluctuate from year to year for natural reasons. In particular, excessive snow and cold in winter will lead to a higher mortality rate for deer, and consequently fewer deer-vehicle collisions. Figure 1 illustrates how collisions with deer in Manitoba were impacted by two very snowy winters (2012/2013 and 2013/2014). More than any other issue, evaluations of interventions aimed at collisions with wildlife need to consider this natural fluctuation.

Manitoba Sustainable Development recently concluded that the deer population has rebounded somewhat, contributing to a rebound in the number of collisions with deer, but the population has not quite reached 'normal levels'. The department observes additional likely reasons for recent increases in collisions with deer: the increasingly high volume of commuters travelling to Winnipeg from distant bedroom communities, at high speeds, across prime deer territory (e.g. Interlake, Highway 1, etc.).

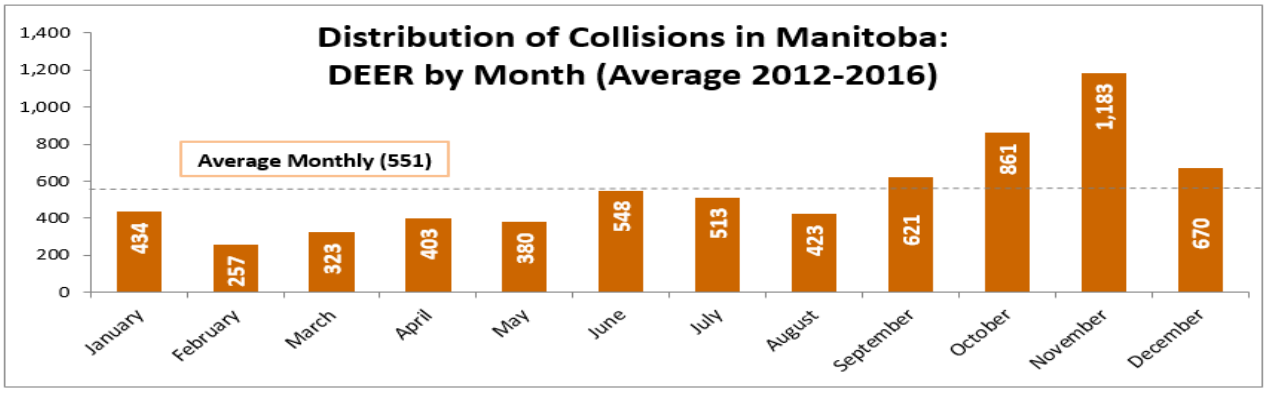
Figure 1



Source: MPI Claims Collisions Statistics Database (excluding collisions with $0 incurred)

Peak time for risk is important to know for the deployment of interventions. The frequency of collisions with deer begins to significantly exceed the average in October. (See Figure 2, below) By November the incidence is predictably present. Peak time is dusk to midnight, then again near dawn. Peak risk for bears is late summer / early fall; for moose it is less defined, and includes winter months.

Figure 2



Source: MPI Claims Collisions Statistics Database (excluding collisions with $0 incurred)

Collisions with animals are experienced by drivers of all types of vehicles, including some motorcyclists.

Figure 3

Average Number Wildlife-Vehicle Collisions per Year: By Species/Vehicle Type (2012-2016)

Vehicle Type:	Passenger Vehicles	Trucks	Motorcycles	TOTAL*
Species of Animal:				
BEAR	79	33	0.2	115
BIRD	266	240	0.8	510
DEER	4,672	2,280	13.2	7,038
MOOSE	43	58	0.2	105
Not Applicable	228	66	0.8	298
Other	1,981	803	4.8	2,822
TOTAL	7,269	3,479	20	10,888

**Total may include some incidents where vehicle type is not noted.*
Source: Claims collision data, extracted May 2017. Excludes collisions with $0 financial transaction.

2. Human Toll

Injuries from crashes with deer are relatively few: 472 in 2016 (vs. 361 in 2015, 289 in 2014, and 288 in 2013). Injuries involving moose or bears are even fewer (average of 11 each per year). Fatalities are rare (1 involving deer in each of 2014 and 2015, 1 involving moose in 2012). Though less frequent, wildlife-motorcyclist collisions are important to mitigate as motorcyclists are more vulnerable to injury in any collision.

3. Cost to MPI

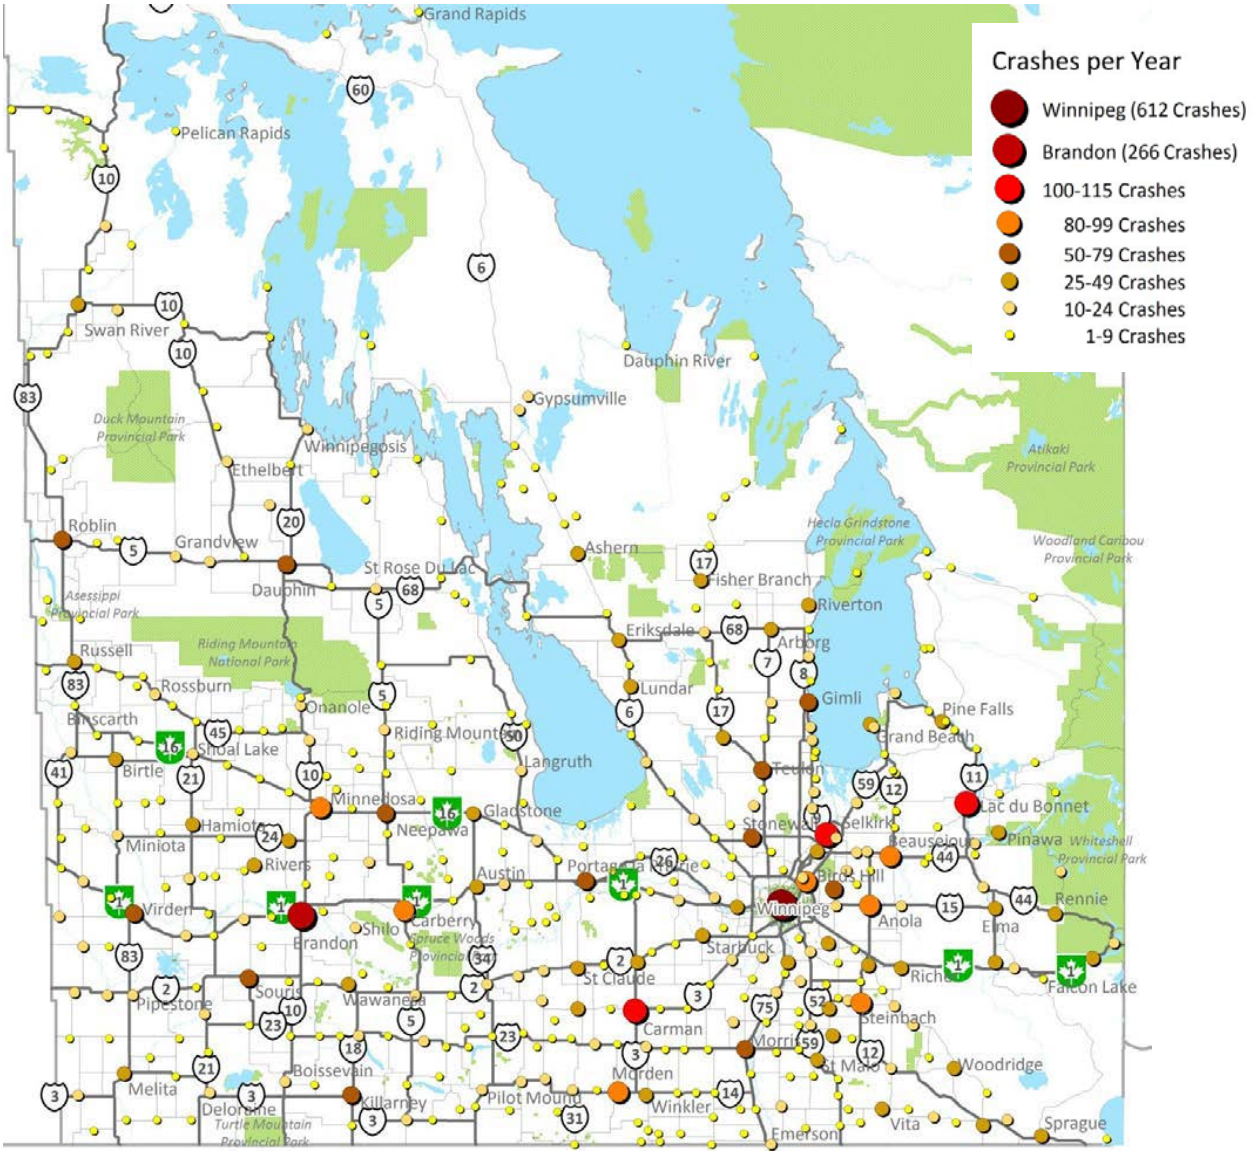
The average cost to MPI per year (2011-2016) for all collisions with animals, as documented in the annual Claims Collisions Statistics Report is over ~ ***$46M per year.***[i] The average cost for a single deer collision involving a passenger vehicle is close to $5,000; when involving motorcycles it is over $36,000.

4. Location of Collisions

Crashes with deer paid out by the Corporation occur mainly in Manitoba (~6% are outside of Manitoba where customers travel). In Manitoba, these crashes are widespread, occurring in virtually every corner of the province. Concentrations of crashes are in part driven by municipal population size and traffic flow along nearby highways, as well as due to the natural concentration of deer in particular areas.

Figure 4

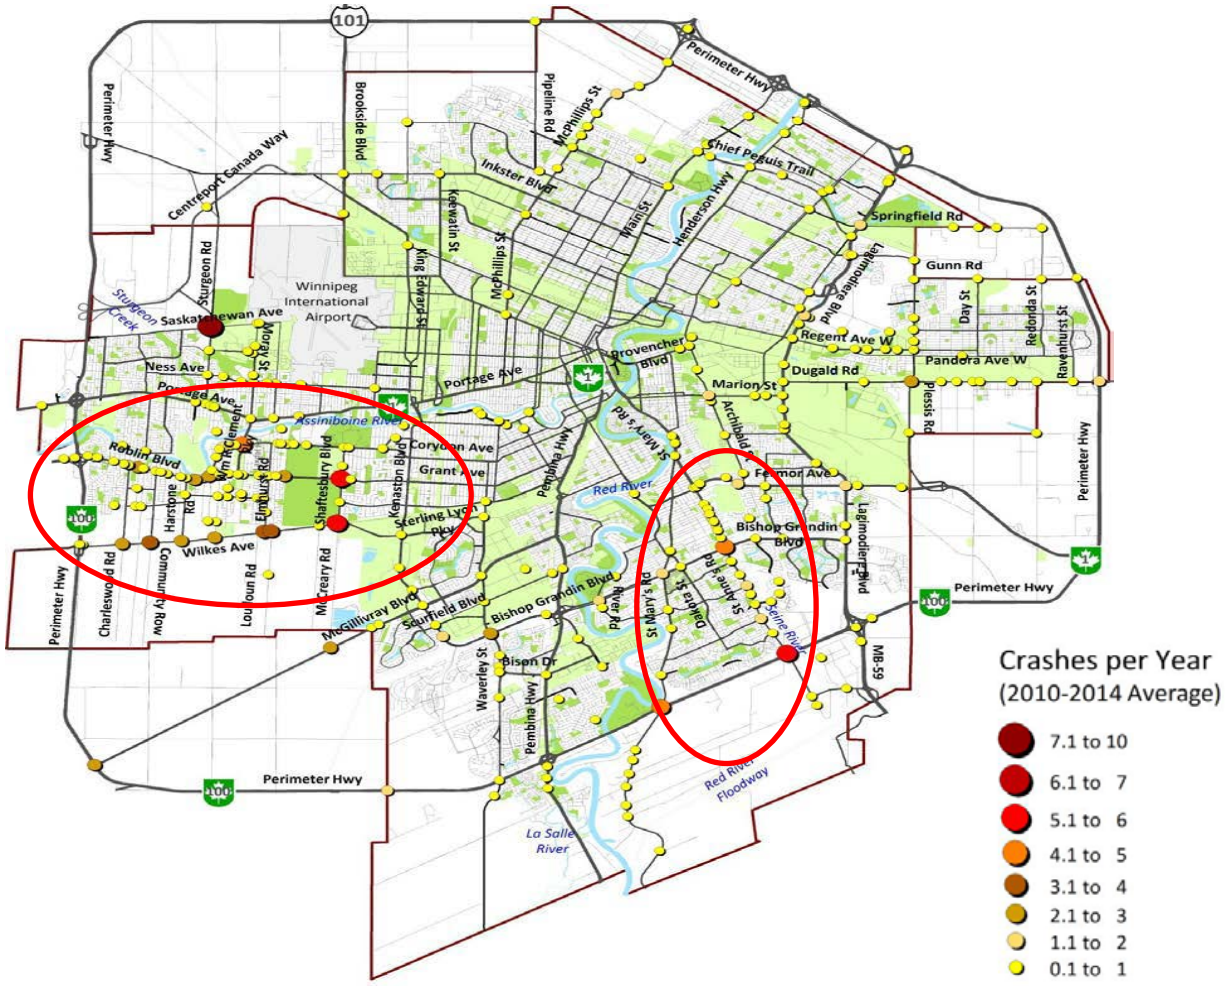
Manitoba: Deer-Vehicle Crashes (2010-2014)
Average Number of Annual Crashes by Nearest Municipality



Similarly, collisions with deer in the Winnipeg area can happen in any section of the City, although there is a larger concentration in the west and southeast sections of the City.

Figure 5

Winnipeg: Deer-Vehicle Crashes (2010-2014)
Average Number of Annual Crashes by Nearest Intersection



B. POTENTIAL MITIGATIONS: WHAT WE HAVE LEARNED

1. Highly Effective Mitigations: (fencing with crossings, roadside detection / warning systems)

Mitigation literature continues to list these two tools as highly effective in preventing collisions (80% +). The disadvantage is primarily cost and, unless there is a detailed knowledge of the exact location of collisions with wildlife, indeterminate lengths of mitigation will prevent a predicted return on investment (ROI). It is also much less costly to install fencing/crossing systems on new vs. existing highways. The loss of protected or endangered species, or serious injury from colliding with a moose, can also over-ride ROI.

- The widespread distribution of deer/vehicle collisions in Manitoba, continues to prevent MPI from benefiting from these solutions.
- For well-known problem areas where MPI has conducted cost-benefit analyses (***Birds Hill Park***, ***Whiteshell Park***), complex landscape and/or too many entrances/exits (access to residents, visitors and small businesses) made fencing solutions particularly costly (a full barrier must be maintained), even before adding the cost of crossing structures (a 'must' for sustainability). Though these treatments are effective where they are placed, without additional costly infrastructure (bridge or tunnel), collision sites are simply moved to the fence ends. Deer entering private/business yards/farming fields as they follow a fence line was another risk. Active detection systems were also costly due to undefined lengths required and are unsuitable for hilly terrain.

➢ External loss prevention stakeholders understand the widespread distribution of collisions, as well as the challenges of our geography, makes costly mitigation tools (such as fencing) non-viable.

2. Seasonal Roadside Signs: (VMS signs, temporarily lit crossing signs, etc.)

Mitigation literature continues to list seasonal roadside signs are 'partly' effective and useful where it is not cost effective to use fencing or active detection warning signs. Such signs deliver a well-timed, noticeable message, when and where it is needed the most (as forest fire danger signs do). These signs work by increasing driver attention to the road, and by reducing a driver speed (a little). This improves a driver's chance of stopping in time when animal unexpectedly crosses or appears by the side of the road; or may minimize a collision. A major disadvantage is that their very modest levels of effectiveness prevent their 'real life' evaluation in terms of reducing collisions, given that the population of deer naturally fluctuates from year to year and is only occasionally counted. Reduction in driver speed is the typical alternative and observable outcome used by researchers to demonstrate increased care and attention.

➢ External loss prevention stakeholders are in favour of awareness efforts, and interventions which reduce driver speed, however stakeholders would prefer interventions with proven outcomes.

(a) Variable Message Signs (VMS): Local traffic engineers have so far favoured VMS boards as they draw significant driver attention, and is a reason why MPI has been renting VMS boards on behalf of interested stakeholders. Collaborative research between MPI and City of Winnipeg in 2008 revealed small reductions in speed, consistent with literature. In another MPI-City of Winnipeg project in 2011, citizens in the piloted neighbourhoods identified VMS boards as their primary source of increased awareness of wildlife on their roads. More recently in 2017, collaborative research between MPI and Manitoba Infrastructure revealed slight temporary reductions in driver speed, to varying degrees depending on the research site.[1]

Major disadvantages of VMS are their relative cost, and time required to manage and move them from location to location (maximum recommended time per location 2 weeks). City of Winnipeg (who already own and operate 2 boards) have said they do not have the time to rotate additional boards.

Purchasing a board on behalf of other interested municipalities/parks who do have resources to move the boards around may be more economical than the rental approach used by MPI up to now:

Purchase = approximately $25K *(municipality would move sign themselves between locations)*
Rental Example = $16K for 2 weeks per each of 3 locations *(including labour to move signs)*

If a VMS was purchased for <u>one stakeholder</u>, this would provide the stakeholder with the opportunity to use the VMS in many locations, and to repeat the initiative in the spring (a smaller peak period for wildlife collisions), as well as for other traffic safety messaging.

If a VMS was made available to a <u>different</u> municipality / stakeholder <u>each year</u>, this would enable municipalities to self-identify themselves as having a serious wildlife crossing issue at a specific location.[2] Local experience may help to identify hot spots which would not otherwise be identified. The opportunity to try out a VMS may even result in a municipality's future purchase of VMS board.

(b) Programmable LED Animal Crossing Signs: A simple alteration to a 'standard' wildlife crossing sign is available, featuring solar powered, programmable LED lights, which can be activated periodically, on-site or remotely during peak seasons and times of day (dusk to dawn).

The use of LED wildlife signs continues to be used in B.C. (in select areas, when other mitigations are not possible or cost effective), with indications of good results. This was one of the four key recommendations listed in the B.C. Ministry of Transportation and Infrastructure's 2014 report "Rural Highway Safety and Speed Review", intended to reduce wildlife crashes on B.C. highways:

> "Implement LED wildlife signs in specific high wildlife crash locations and flash the LEDs based on seasonal information."

[1] A draft report of the 2017 VMS-Wildlife Awareness Research project will be available mid-April, 2018.
[2] The Association of Manitoba Municipalities would be asked to assist.

The cost of LED crossing signs is much less than for a VMS board (about $5-6K vs. $25K). The proposed Manitoba Traffic and Transportation Modernization Act would streamline and shift the approval of "non-government highway signage" from the Highway Traffic Board to Manitoba Infrastructure, providing a potentially swift approval to pilot this type of sign in Manitoba.

3. New Vehicle Safety Technologies:

Driver assist features specifically designed to detect and warn drivers of wildlife at night are currently available in luxury vehicles, but are expected to be available in non-luxury vehicles in the near future.

In the meantime, drivers are more likely to recover from a sudden wildlife encounter by:

- choosing a newer vehicle with features that improve stability and braking performance, and
- focusing all of their attention to the road and minimizing distraction.

➢ There was general support for monitoring the promising advances in vehicle technologies and efforts to raise more awareness of vehicle safety features in consumber buying decision; with some caution on how these technologies may encourage higher-risk drving behaviour by giving drivers a false sense of security.

4. Speed Reduction Options:

(a) Traditional Speed Enforcement: Exceeding the speed limit does occur in areas with considerable wildlife movement, and hot spots for wildlife collisions, despite the presence of traditional animal crossing signs (as drivers become habituated to those signs). Though highly visible speed enforcement would aid in reducing driver speeds, the ad hoc and widespread nature of vehicle-wildlife collisions makes allocating enforcement resources for the sole purposes of wildlife collision reduction very difficult.

(b) 'Point-to-point' (PTP) Automated Speed Enforcement. While police agencies may not have the ability to continually patrol hot spots for wildlife, PTP may be an affordable solution in the future - should traffic safety culture result in a greater acceptance of automated speed enforcement.

(c) Variable Speed Limits: Variable speed limits are used when a hazard will be visible (e.g. icy road, rocks) or scheduled over a defined period (road construction). In other provinces, variable speed limits may be used for wildlife when a species is migrating across a defined path, or when webcams or highway officials have received word of an injured animal up ahead on the roadway (as in B.C.). The presence of deer on Manitoba roads is unpredictable and may not be a consistently visible hazard for use with a variable speed sign. If this approach were used in Manitoba, motorists would in all likelihood continue to drive to the speed they feel is safe and not reduce their speed, unless enforcement was present or perceived to be present.

(d) Temporary Speed Bumps or Rumble Strips: Temporary rubber speed bumps or rumble strips have sometimes been used in other jurisdictions for various issues. Manitoba Infrastructure may wish to reconsider this option as a seasonal speed reduction during wildlife season, where safe.

- External loss prevention stakeholders were in favour of interventions which reduce driver speed. Suggestions included variable speed limits in wildlife hot spots.

5. Other Key Mitigation Options:

- Neither deer whistles nor reflectors on highway posts have proven to be effective. Similarly, no additional mitigations have been identified to reduce the vulnerability of motorcyclists (thankfully, the majority of wildlife collisions occur in October and November when deer (and moose) are most active and there are less motorcycles on the roads).
- Culling the population of wildlife can be an effective tool for communities which deem the concentration of deer too high for the community. Sterilization is very expensive and short-term.

6. Better Crash Location Detail:

Major stakeholders, including Manitoba Infrastructure recognize a need for more detail on wildlife-vehicle collision (WVC) locations. A better system is needed for identifying concentrated collision hot spots. One potential solution includes a carcass location recording app. At least two other provinces (B.C., Alberta) operate a roadside (large) animal carcass reporting system, operated by maintenance and animal conservation staff.

In 2017, MPI proposed to help pilot this solution, and remains willing to help fund any required devices, as needed. MPI awaits Manitoba Infrastructure decision on further planning and participation.

C. PROPOSED STRATEGY FOR 2018/2019:

1. GENERAL PUBLIC AWARENESS AND EDUCATION:

(a) Repeat the annual seasonal public awareness campaign *(Included within existing Communications budget).* New: Highlight how distracted driving can also impact collisions with wildlife.

Summary:

Since it is proven that drivers become habituated to wildlife crossing signs, and that the primary hazard (deer) is particularly present in the fall, MPI will continue to lead Manitoba's annual fall campaign, reminding Manitobans to be alert for the increased risk of wildlife on the road. Messaging will focus on the random location of deer (deer are everywhere), and for vehicle drivers/motorists to be alert at all times. Messaging will be updated as necessary, in paid advertising spots (radio, digital billboards, newspaper and 60-Second Driver TV featured tips, social media and ATM spots), quick radio tips ('PSA'), a prepared community newspaper column ('The Manitoba Driver') and media relations activities (news release).

Objectives:

- Remind Manitoba drivers of the increased risk of collisions with deer in October and November.
- Remind drivers and riders to scan ditches on both sides of the road, during the day and night.
- Call for increased attention at all times, and wherever there are wildlife signs, during peak times (dusk to dawn). Note: reminder that dusk occurs earlier in the day as move into fall season, so drivers and riders are not caught off-guard as visibility decreases and wildlife movement increases.
- Maintain awareness of tips for reducing risk of collision and injury: most importantly - reduce speed – as faster speed reduces reaction time, know what to watch for, and how to stay in control (avoid swerving).
- Highlight how tips for preventing distracted driving can further prevent collisions with wildlife:
  - Never use hand-held devices;
  - adjust in-vehicle climate controls, GPS and infotainment options before you drive;
  - try not to focus too long on any one spot; encourage passengers to also scan the road while talking with you.

(b) Update maps for deer collision hot spots (website) *(Included within existing budget)*

Summary:

The currently posted maps illustrating deer collision 'hot spots' in Manitoba and Winnipeg will be updated, based on 2013-2017 data.

Objectives:

- Provide a resource for identifying areas with the highest frequency of collisions with deer.

(c) Introduce new vehicle technologies which may benefit this issue (website) ***(Included within existing budget)***

Summary:

MPI's corporate website 'Road Safety' section includes a sub-section on wildlife collisions. These pages are a ready resource for the public, stakeholders, media and educators who similarly seek to share information, with more detail and links than in MPI advertising materials.

New information will be presented on these pages (and other places where possible, such as articles prepared for community newspapers) introducing the benefits of new and emerging in-vehicle safety technologies. Some technologies are specifically designed to help detect animals and warn drivers, and quickly slow a vehicle down as a result). Others improve stability and braking performance, also critical to this issue.

In addition to new vehicle technologies, information on the benefit of replacing headlights and driving lights on motorcycles with modern brighter LED or similar lights would help riders to not over-drive their lights and reduce collisions.

Objectives:

- Begin to create positive perceptions of new in-vehicle technologies specifically designed to minimize the severity of collisions with animals, as well as for other newer safety technologies aimed at improving vehicle stability and braking performance which can also help deal with sudden animals.

2. ADDITIONAL AWARENESS IN HIGHER COLLISION AREAS:

(a) Purchase a VMS for permanent use in Riding Mountain National Park (RMNP) for the purposes of wildlife awareness. ***(Approx. $25,000)***

Summary:

RMNP staff have been very supportive of wildlife messaging within the park over the last few years, through MPI's rental of VMS board on their behalf. This year, MPI would purchase a single VMS board (approximate cost of $25,000) and loan it to the Park. The vendor will provide full training on the operation and the safe transport of VMS units.

The benefits of a purchase (vs. rental) approach include: greater cost efficiency, as well as unlimited usage by Park staff, for both wildlife messaging and other park safety or traveler information.

- The existing rental program ($16K) provides for 2 weeks per 3 locations. (vendor moves VMS)
- The purchase of one board ($25K) would allow RMNP to move a board throughout fall, winter, and spring for all animal movement including moose. (RMNP would provide labour to move VMS)

VMS locations are set according to crash statistics and Park staff experience (carcass pickup) for positioning of boards. This effort recognizes that although the number of collisions may not be extremely high in the Park, the intervention will prevent severe collisions, particularly involving moose, as well as involving deer.

Objectives:

- Provide site-specific seasonal reminders to be alert for deer
- Cause drivers to slow down, providing additional time to stop for animals on the road and/or reduce the severity of the crash

Messaging:

Messaging will be consistent with Parks Canada approved messages. Two messages will rotate on each board, with the approved appropriate length of time and interval.

- 'BE ALERT FOR WILDLIFE' / 'ATTN. A LA FAUNE' *(a French message is required for Parks Canada)*

Program Alternative:

- Road Safety Programming could continue to rent VMS signs on behalf of RMNP.
- Should staff be uncomfortable with moving the VMS themselves, Road Safety Programming may seek additional budget as necessary for the vendor to move the VMS a number of times. The cost of purchasing a unit will still be lower than renting the unit over the course of two years.
- Road Safety Programming could also rent the VMS to another self-identified municipality with a serious wildlife-traffic issue, with the help of the Association of Manitoba Municipalities.

3. GREATER DETAIL IN COLLISION DATA:

(a) Work with Manitoba Infrastructure (MI) maintenance staff to pilot an app for the recording of GPS locations of animal carcasses along Manitoba highways. ***($50,000)***

Summary:

A roadside (large) animal carcass reporting app would be operated by Manitoba Infrastructure's road maintenance and animal conservation staff. The Government of Alberta's smartphone app is recognized as a model approach. The app would not only allow onsite recording of GPS detail; optional software could then assess the landscape and distribution of collisions to suggest the optimal combination of mitigation approaches required to achieve a desired reduction and return on investment. MPI would help fund required devices and the app itself, and to provide other assistance, as needed, including overseeing an evaluation. MPI awaits Manitoba Infrastructure decision to proceed.

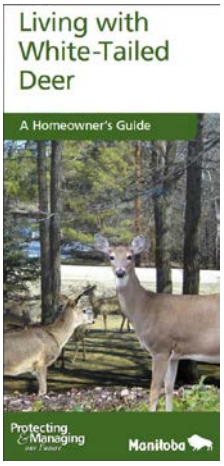
Objectives:

- Collaborate on creating and maintaining a system which is: a) Simple and quick to use, b) reliable and defensible, c) provides infometrics to meet long-term needs of key stakeholders who will benefit from data collected, and d) includes menu choices which will ease interpretation and filtering of subsequent periodic reports. Other potential considerations: e) features for uploading and managing of supporting photos, f) scalable mapped visualization, and g) easy data-sharing.
- Encourage continued observations/data collection: Periodic encouragement of staff is essential, such as: importance of initiative, project goals and updates, incentives (small draws) and media stories.
- Conduct a 12-month evaluation of the pilot: Identify any operational issues which may compromise the integrity of the resulting data. Identify whether any sufficiently concentrated hot spots exist for highly effective mitigations (fencing or active detection systems), or modestly effective mitigations.

4. STAKEHOLDER COLLABORATION:

(a) Provide one-time support to Manitoba Sustainable Development, for the printing of a revised wildlife 'fact sheet.' ***(Approx. $5,000)***

Summary:



An educational leaflet was created a number of years ago by Manitoba Conservation (now Manitoba Sustainable Development), in partnership with MPI. The leaflet included a variety of tips for Winnipeg residents on how to reduce conflicts (incl. traffic collisions) with white-tailed deer while still enjoying the natural beauty of wildlife.

Sustainable Development Manitoba is now amalgamating all of its wildlife communications into one fact sheet (including BearSmart with collision prevention tips), and must pay for the cost for redesigning the material. Consistent with its past support, MPI would contribute by funding the printing of this new fact sheet, allowing it to be distributed at presentations made by Sustainable Development Manitoba.

Objectives:

- Leverage an additional opportunity for increasing awareness of wildlife collision prevention tips.

(b) Continue to Support to the City of Winnipeg-Owned VMS-Wildlife Awareness program. ***(No additional cost to the Corporation)***

Summary:

The members of the Manitoba Wildlife Collision Stakeholders Committee (including MPI) correspond with each other throughout the year, sharing collision data, other data and issue insights, collaborating where possible on related projects.

One particular on-going project includes MPI's review of the latest Winnipeg collision data, and collaboration with a member of the Traffic Management Department within Public Works at the City of Winnipeg, to identify the best locations where VMS boards may be rotated to remind or create awareness about the higher likelihood of encountering deer along particular corridors. The City of Winnipeg agreed in 2009, to reserve their two VMS boards each fall, for this purpose.

Variable Message Board (VMS) Placements – Winnipeg (Fall 2017)

Objectives:

- Facilitate the exchange of sources of information for the mutual goal of reducing wildlife collisions.
- Provide site-specific seasonal reminders to be alert for deer.

(c) Encourage Municipalities and Manitoba Infrastructure to conduct more brush clearing and grass mowing along highway shoulders and ditches in rural 'hot spot' areas. ***(Included within existing budget)***

Summary:

Long grass and brush adjacent to highway shoulders provide ideal hiding spots for wildlife and casts a high shadow across ditches making animals less visible. The close proximity to the roadway reduces reaction times for drivers and riders, especially in low light situations. Clearing this area immediately next to highway would discourage wildlife from seeking shelter in these areas, thereby removing them further from the roadway.

MPI will encourage maintenance crews in rural hot spot locations to maintain these areas.

Objectives:

- Foster communication between rural municipalities and local residents in identifying areas where high frequency of collisions with deer result from unmaintained road shoulders or ditches.

5. RESEARCH TO SUPPORT PROVEN / PROMISING INTERVENTIONS IN MANITOBA:

(a) Examine the effectiveness of wildlife crossing signs which feature a programmable, seasonal, LED mini-light surround. *(REQUIRES MANITOBA INFRASTRUCTURE APPROVAL)* ***(Approx. $50,000)***

Summary:

This research will test and confirm the effectiveness of LED-lit crossing signs, at three well known hot spots (identified by stakeholders including Manitoba Infrastructure) on a provincial trunk highway or provincial road, during peak times for deer-vehicle collisions (from dusk to dawn in October, before snow and ice are likely to appear on the road). LEDs are highly visible, more so than standard signs which motorists may have become habituated to. Because they are programmable, they can be set for lowlight hours, the exact times when deer are more likely to be about.

The signs should make drivers more alert; a local resident phone survey will measure perceived alertness due to the signs. The signs will also ideally lower driver speed, in which case the driver is better prepared to take potential action, reducing severity if not avoiding a collision. An acceptable traffic data measuring device (e.g. VMS trailer-display screen turned down) will collect speed data.

Explore including a message sign below LED mini-light surround sign that relays a safety message – such as 'Wildlife Area – Reduce Speed' – when LED lights are lit.

Objectives:

- Provide site-specific seasonal reminders to be alert for deer.
- Measure the amount by which drivers slow down, by time of day, compared with periods of time before the LED surrounds were installed.
- Seek feedback from citizens who drive in these areas, to confirm the perceived usefulness of these signs, and the degree to which they believe they were more alert as a result of these signs.

Alternative:
A driver simulation study (participating students recruited on campus), where outcomes include vehicle speed and braking in time for wildlife. (REQUIRES SEEKING UNIVERSITY INTEREST AND APPROVAL)

D. SUMMARY OF PROPOSED STRATEGY, ACTION ITEMS AND BUDGET (2018/2019):

The following is the recommended strategy in a nutshell, for addressing wildlife collisions in 2018/2019. Additional details are found in the subsequent pages.

Action Items	Timing	Budget
General public awareness and education:		
Repeat the annual seasonal public awareness campaign with usual tips to help avoid or minimize these types of collisions (speed, alertness, staying in control) • Highlight how distracted driving can impact collisions with wildlife • Introduce new vehicle technologies which may benefit this issue (website)	Fall Fall TBD	NO Additional Cost **(NAC)**
Update maps for deer collision hot spots	Summer	NAC
Additional awareness efforts in higher collision areas:		
Purchase a VMS on behalf of Riding Mountain National Park (RMNP). *Benefit:* Existing rental program ($16K) provides for 2 weeks per 3 locations. The purchase of one board ($25K) would allow RMNP to move a board throughout fall, winter, and spring for all animal movement including moose. *Alternative*: Continue to rent VMS signs on behalf of RMNP, or another self-identified municipality with a serious wildlife-traffic issue.	Fall / Winter	$25,000 (estimate)
Greater detail in collision location data, to identify locations for cost effective mitigation:		
Work with Manitoba Infrastructure (MI) maintenance staff to pilot an app for the recording of GPS locations of animal carcasses along Manitoba highways. Funding provides for smartphones and app as required *(awaiting MI agreement)*	On-going	$50,000
Stakeholder Collaboration:		
Re-direct current funding for VMS rentals in Winnipeg in favour of research to help assess the effectiveness of less costly roadside signs. (See Research). Continue to support the City's own 2-VMS program by assessing collision data.	On-going	NAC
Provide one-time support to Manitoba Sustainable Development, for the printing of revised wildlife 'fact sheets' used at presentations, containing key tips for preventing collisions.	TBD 2018	$ 5,000
Share crash location information and issue knowledge with members of the Manitoba Wildlife Collision Stakeholders Committee to support initiatives.	On-going	NAC
Encourage more brush clearing and grass mowing along highway shoulders and ditches in rural 'hot spot' areas with Municipalities and Manitoba Infrastructure	TBD 2018	NAC
Research to support proven and promising interventions in Manitoba:		
Examine the effectiveness of wildlife crossing signs with a programmable, seasonal, LED mini-light surround. Potential approaches currently include: 1. A driver simulation study (participating students recruited on campus), where outcomes include vehicle speed and braking in time for wildlife. *(REQUIRES UNIVERSITY INTEREST AND APPROVAL)* 2. An on-road trial in three locations (identified by stakeholders as problem areas), where outcomes include vehicle speed and a local resident survey. *(REQUIRES MANITOBA INFRASTRUCTURE APPROVAL)*	Oct. / Nov.	$50,000
TOTAL:		$130,000

(PAGE LEFT BLANK INTENTIONALLY FOR DOUBLE-SIDED PRINTING)

APPENDICES:

(PAGE LEFT BLANK INTENTIONALLY FOR DOUBLE-SIDED PRINTING)

APPENDIX 1: Summary of External Loss Prevention Stakeholder Consultation

The Public Utilities Board asked MPI to commence discussions with Coalition of Manitoba Motorcycle Groups regarding wildlife collision prevention initiatives. As a precursor, MPI sought to gain the views and input from all of its loss prevention stakeholders to obtain feedback on current interventions and potential strategies to reduce wildlife collisions.

Prior to the meeting, a briefing document on wildlife collisions was circulated that outlined yearly collision statistics, claims costs, collision location information from "hot spot" maps, an article on potential collision avoidance utilizing emerging vehicle technology, and a list of questions regarding the issue of wildlife collisions. This information was provided prior to the presentation to help facilitate discussion.

Wildlife presentation highlights:

- MPI's focus has been on raising awareness during peak wildlife collision season (Oct-Dec) through media channels and placing variable message boards in collision hot spots.
- Working with the City of Winnipeg and national park service, MPI has expanded VMS warning signage in recent years.
- MPI has fully explored wildlife fencing in the past decade and results of cost benefit analyses were also shared.
- Mitigation studies have shown fencing to be very effective in eliminating collisions within the fenced zone, but collision frequency typically increases at either end of a fencing application. The high cost and limited benefit has not enabled a successful business case for application in Manitoba.
- MPI has and continues to pursue research on wildlife hotspots and driver behaviour in response to public awareness campaigns and temporary signage.
- Information on promising automated collision avoidance technologies and the current rates of adoption and public perceptions about the technology was also presented.
- MPI is prepared to look at new strategies provided they are cost effective and have the potential make a difference in claims and/or road safety.

The following was discussed:

- How do wildlife collisions compare to other road safety priorities established by MPI and under the Provincial Road Safety Action Plan. It is important to keep this issue in perspective when determining how best to utilize resources and funding.
- The importance of data collection and use was stressed. Hot spot mapping should continue along with work to better pinpoint where collisions are occurring within those hotspot regions. Other statistical data such as time of day, age of drivers, vehicle speed at time of collision, road and weather conditions are also relevant.

- Public awareness continues to be important and led to discussion about the effectiveness of permanent versus temporary and variable signage. Signage should display 'action-based' messaging (i.e. reduce speed). Opportunities to use social media to enhance public awareness and education and more targeted messaging based on geography and demographic data for drivers involved in wildlife collisions could be considered.
- Opportunities for joint and coordinated awareness efforts among committee member organizations were discussed to maximize impact and reach.
- The effectiveness of deer whistles, roadside reflectors and other strategies were discussed, have been examined, and found to have little impact.
- Collisions by year tend to vary with the size of the deer population. There was discussion about how the population is monitored, by whom, how the population is affected by climate and the availability of food sources, and strategies used in other jurisdictions to control the deer population.
- Infrastructure-related solutions were discussed, including the concept of variable speed limits and the associated challenges with enforcement. The cost/effectiveness of roadside fencing was also discussed and whether prior business cases would at some point have a more positive return on investment as the collision counts increase. The challenge in achieving a positive cost/benefit analysis for roadside fencing was discussed as relating more to the dispersion of collisions throughout Manitoba, the cost to install and maintain fencing on an ongoing basis, infrastructure/geographic-related challenges, and the fact that collision hotspots generally move to fence end points rather than eliminate collisions completely (Saskatchewan pilot project).
- There was general support for monitoring the promising advances in vehicle technologies and efforts to raise more awareness of vehicle safety features in consumer buying decisions; with some caution on how these technologies may encourage higher-risk driving behaviour by giving drivers a false sense of security.

Further, Committee members were asked to submit any additional comments or suggestions by email.

Comments from Manitoba Trucking Association (MTA):

- Manitoba grain facilities typically do not allow grain haulers to clean out their trucks on-site, leading many operators to clean out their vehicle at roadside, rather than travel to a more "friendly facility".
- They believe it is, or certainly may be, contributing to roadside collisions with wildlife who are attracted to the dumped grain.

Comments from Consumer's Association of Canada (CAC) Manitoba:

- Collisions with animals on Manitoba Highways and City streets continue to be a cause for concern. However, this must be kept in perspective, relative to all the other issues that are causing deaths and injuries in Manitoba. Wildlife Vehicle Collisions were not identified as a priority issue by the MPI road safety programming group when they presented their 2017/2018

plan. Neither is there any reference to it in the most recent "Manitoba Road Safety Plan – 2017-2020: Road to Zero.

Responses to pre-meeting package questions:

Question 1: What are your thoughts on our approach?

- *General Public Messaging*: Mass media and online reminders would be a good idea if they could be specifically aired/available during the times when wildlife vehicle collisions are most prevalent, such as between September and December. TIRF's Road Safety Monitor 2016 recommends that "*drivers require more education on proper responses and need to practice visualizing the proper responses in order to avoid automatic avoidance behaviours*". It is reassuring that more than half of the respondents to the TIRF Road Safety Monitor in 2016, think they should perform what is commonly regarded as the best road safety response, at least in most situations, which is ***to slow down and drive straight***. This allows drivers to stay in control of the vehicle as well as increases the chances that the situation can be assessed and proper action continues to be taken. As an aside, honking the horn, similar to flashing the headlights, should not be done as the unpredictable behaviour of animals means that the animals may run towards the vehicle, into the pathway of other road users.
- *Awareness efforts in higher collision areas*: Variable message signs (VMS) could be challenging in Manitoba, since MPI recognizes that collisions with wildlife are very widespread and random throughout the province.
- Wor*king with partners to improve location data*: This is always a key requirement, challenging as it may be. Is it possible that data is available through other departments of government or the highway maintenance contractors? (In BC the highway maintenance contractors clear animal carcasses from the highways).
- *Working with partners to test effectiveness of promising interventions*: The key program here is Speed Management, linked to enforcement. Variable Speed Limits (signs) could be used to have lower speeds during the time of high numbers of crashes. These must be backed up with effective enforcement. This also includes the potential for lower speed limits on municipal roads that may experience high numbers of animal collisions.
- *New vehicle technology*: There are areas of promise here. Transport Canada reports the evolving improvement of safety measures in vehicles. This is a brief summary of relevant measures:

Measure	Pros	Cons
Infrared sensors	Increases drive response time. Suitable outside urban areas. Increases vision. Promising technology.	Available on high-end vehicles only. May become distracting. Complaints about size and resolution.
Enhanced headlights	Increases drive response time. Suitable outside urban areas. Increases vision 2X to 3V. Longer life. Enhances peripheral vision.	May blind other drivers if lights are nor adjusted or cleaned.
Adaptive front lighting system	Dynamic bending of light, enhances vision up to 4 degrees in curves. Improved driver comfort and safety. Reduces glare on wet road.	
Electronic Stability Control (ESC)	Helps in evaluation of lateral stability of vehicle. Enables better vehicle comparison. Showing great promise in Europe and North America.	
Collision warning systems	Increases drive response time. Suitable outside urban areas. Very promising technology.	

Question 2: What do you think the approach should be?

- Integrated Speed Management.
- Promotion of the use of vehicle safety devices and the purchase of vehicles that have these features.
- Any messaging should focus on "telling the driver WHAT to do, i.e. slow down and drive straight, and NOT on what not to do, i.e. swerve, brake hard.
- Try to get more data from other partners.

Question 3: What do you believe will be the barriers to adopting new and emerging vehicle safety technology?

- *Barriers to adopting new and emerging vehicle technology*: The cost of repairing vehicles with these new technologies is much greater than older vehicles. Bumpers, windows and mirrors that contain sensors or cameras are much more costly to replace. It used to be that only "high-end" vehicles had these features, but now more lower-priced vehicles are on the market with these safety devices.
- Wildlife Vehicle Collisions is a problem globally, to which no-one has found the ultimate "silver bullet". Even European countries that have installed miles of fencing have not solved the problem since even this initiative (fencing) has the potential for negative effects or unintentional consequences.

Question 4: What do you think is the public's perception of the available technology?

- *Public perception of technology*: As far as we have been able to determine, no-one has undertaken such a study. This is an area, however, where some research should be done. Research from the public's perspective is vital as a tool for making sound decisions in the marketplace.

Question 5: Are there other possible solutions we should be considering?

- A*re there any other possible solutions*? – The TIRF Road Safety Monitor 2016 revealed that generally speaking, as one ages the odds of hitting wildlife decreases over time. This may suggest that more experienced drivers are better able to avoid colliding with wildlife. Despite controlling for factors such as kilometres driven and urban versus rural areas it is also possible that as drivers age, they may not drive as much as younger drivers, they may not drive as frequently in areas where wildlife are present, or they may use other modes of transportation to reach destinations. However, as age increased among those who hit or almost hit wildlife, their likelihood for slowing down and steering straight decreased. This begs the question – Is this topic covered in the High School Driver Education Program in Manitoba?

CONCLUDING REMARKS - CAC

- Due to the environment, geography and habitat of local wildlife, Vehicle Wildlife Collisions will be an ongoing issue – but we should ask ourselves one important question: when weighed against other issues causing death and injury on Manitoba highways, what amount of human and/or financial resources should be dedicated to this issue, with a view to putting resources where they can be used most efficiently to save lives on Manitoba highways?

Comments from Automotive Trades Association (ATA) of Manitoba:

Suggested Questions for Discussion

1 & 2. What are your thoughts on our approach?

- *General public messaging*: Radio advertising likely reaches more audience as younger populations are moving away from cable TV to streaming.
- *Awareness efforts in higher collision areas:* At first new signage if lit appears to work; however, over time their impact lessens as drivers become immune to the visual cues. For example, when the high collision signage was posted on Leila at McPhillips, the temporary lit signage attracted attention. Once replace with permanent signage it blended into the streetscape and doesn't have the same impact. It's more visual noise. So, in my view, any signage needs to "rise" above the surrounding visual noise. Example – Colorful, High Impact Media Boards
- *Working with partners to help test the effectiveness of promising interventions*: MPI's data from post implementation reviews of its previous high collision signage efforts is likely a suitable proxy for effectiveness of signage in general. I don't know if there would be a significant change with wildlife signage.
- *New vehicle technology:* This is likely the best tool for preventing wildlife-related collisions for a set period of time (like the immobilizer program).

3. What do you believe will be the barriers to adopting new and emerging vehicle safety technology?
    - Probably buy-in; i.e. will the public believe it will make a difference to their safety. Overcoming "it won't happen to me" until it does and then you care especially if it was.
    - If wildlife claims have risen to the top of the priority list, then it's not too early. MPI knows what its priorities and finances are and if dollars are spent over too many prevention initiatives then this may dilute potential effectiveness

4. What do you think is the public's perception of the available technology?
    - Nice to have; not necessarily something I would go out to spend my disposable income on unless I was purchasing a new vehicle.

5. Are there other possible solutions we should be considering?
    - Tips on avoiding wildlife collisions; how and where to look for the animal when in high population areas

APPENDIX 2: Paper Form Used for Recording Wildlife Carcasses in B.C.

The following paper form is used by B.C. road maintenance staff for the mandatory logging of details concerning wildlife carcasses on the road. **A mobile app is currently being considered,** serving multiple purposes, which would no longer necessitate the use of highway markers (LKI).

BRITISH COLUMBIA | Ministry of Transportation and Infrastructure

WILDLIFE ACCIDENT REPORT REPORTING SYSTEM (WARS)
MONTHLY WILDLIFE ACCIDENT REPORT

This form is used to report wildlife carcasses found on Ministry roads and highways for the Wildlife Accident Reporting System (WARS). The information is used to support Ministry efforts to protect motorists and wildlife. If your service area has no wildlife carcasses to report this month, please check the "Nil Report" box below and submit the form.

MONTH *(Please Circle)* **Jan Feb Mar Apr May Jun Jul Aug Sep Oct Nov Dec** **YEAR** .....

Enter the day of the month (e.g. 1, 2, 3, ... etc.) in the "Date" column below.

REGION *(Please Circle)* **1 2 3** **DISTRICT** ..... **SERVICE AREA:** .....

☐ **Nil Report - No wildlife carcasses to report**

Date of Pickup	Time of Kill (1 = Dawn, 2 = Day, 3 = Dusk, 4 = Dark)	Location of Killed Animal (RFI = Road Features Inventory (optional); LKI = Landmark Kilometre Index (must be completed))						Deer Sign within 100m	Deer Rfletr	# Killed	Animal Type (Please Specify Sex (Male / Female / Unknown); Please Use "Y" to indicate if Yearling or Younger; (Other: Sheep, Caribou, Coyote, Porcupine, etc))												Comments

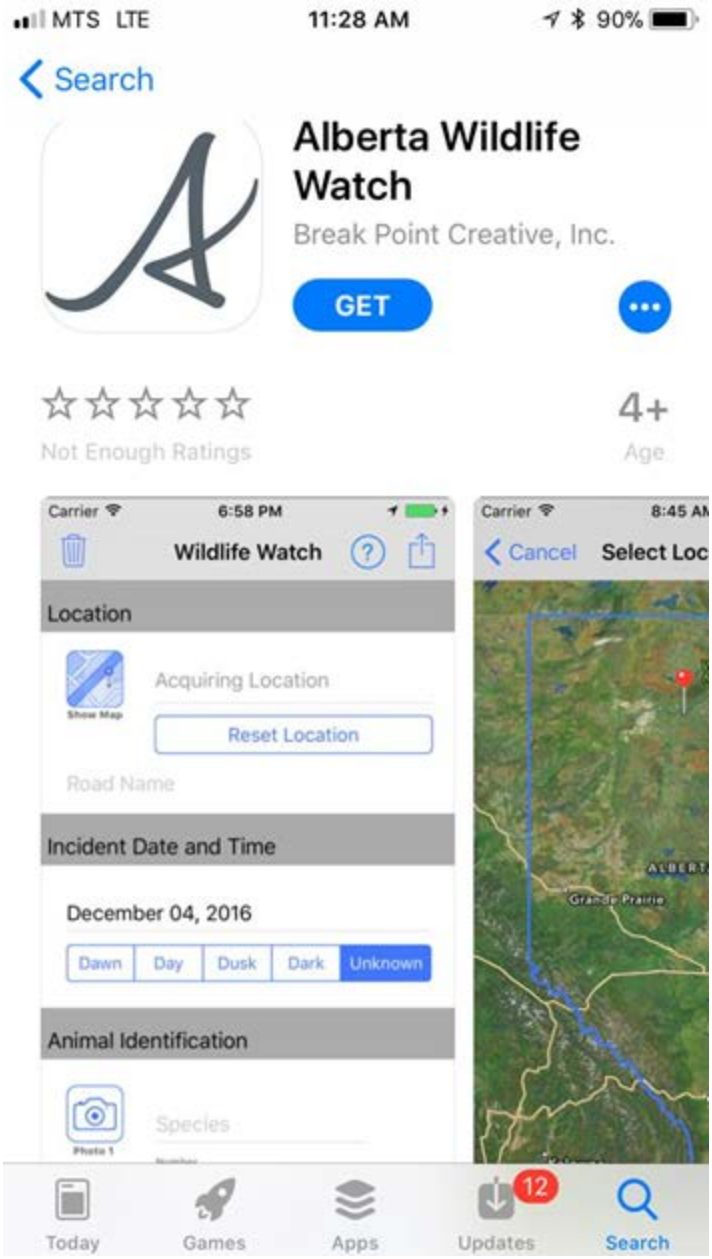
APPENDIX 3: Alberta Online Form for Roadside Maintenance Staff



APPENDIX 4: Cost Estimate Details for Enhanced Crossing Sign Research

Impact of Enhanced Widlife Crossing Signs on Driver Speed and Ability to Avoid a Wildlife Collision, as Determined by Driver Simulation				
COST ITEM:	Number	Rate	Hours	Cost
Software Designer (adapting existing B.C. program)	1	$100	50	$5,000
University Researcher - Project Management/Report	1	$60	70	$4,200
Assistant Researcher - Test Time*	1	$20	38	$760
Assistant Researcher - Data Compilation Time	1	$20	25	$500
Recruiting: University Students (on-campus posters, etc.)	0	$0	0	$0
Participants: Control Group (regular wildlife crossing signs)	150	$50	1	$7,500
Participants: Test Group (signs w. LED surround / amber	150	$50	1	$7,500
TOTAL COSTS:				$25,460
ASSUMPTIONS REGARDING TEST TIME:				
▪ 4 computer stations available at same time				
▪ 12-minute drive simulation				
▪ 3 drives per hour per station / 8 min. in between:				
min.				
▪ Per hour: 3 drives x 4 stations = 12 participants				
▪ Total Test Time: 300 participants / 12 = 25 hours*				
Hinges on university interest and approval.				
Hinges on B.C. researcher interest in adapting simulation used in previous wildlife signage research.				

Impact of Enhanced Wildlife Crossing Signs on Driver Speed and Alertness, as Determined by On-Site Traffic Information, and Local Resident Survey						
COST ITEM:	**Rate**	Number	Days	Hours	Number of Locations	Cost
Purchase of Enhanced Crossing Signs*						
▪ 1 per direction on 1 identified road per municipality	$5,000	2			3	$30,000
▪ Potential transport fees per unit from vendor	$150	2			3	$900
Speed Measurement Device						
▪ Daily rental for 1 VMS trailer (display turned down)	$100		21		3	$6,300
▪ Labour to transport 1 VMS trailer to site	$75			4	3	$900
▪ Labour to transport 1 VMS trailer from site	$75			4	3	$900
Local Resident Survey						
▪ 5-min. phone survey, assessing self behaviour (single location)	$10,000				1	$10,000
TOTAL COST:						$49,000
Hinges on Manitoba Infrastructure input:						
▪ approval to test new sign						
▪ input from maintenance staff on known hot spot						
**Rentals are not possible.*						
**Purchase price estimated only based on past notes; further details are expected soon.*						
NOTE: Contact in B.C. for almost all wildlife collision prevention questions is Len Silecki, however due to holiday period confirmation of costing may arrive sooner from the B.C. signage department, as arranged by Marc Traverso, 1-250-952-6588.

APPLICATION RATE TABLES

ART.1 MISCELLANEOUS PERMITS AND CERTIFICATES

The ART.1 table displays the 2019/20 rate associated on Miscellaneous Permits and Certificates. For 2019/20, no changes are proposed to Permits and Certificates.

Figure ART-1: 2019/20 Miscellaneous Permits and Certificates

Insurance Use	Purpose	Premium
1. Interim Registration Permit[1]	7-Day Permit (issued by Dealers)	$29
2. Temporary Registration (30 day maximum)[2]	1 to 5 Days Each Additional Day	$29 $5

[1] A permit issued by a Dealer to the purchaser or lessee of a motor vehicle permitting it to be operated for a period of up to seven days.

[2] Provides insurance and registration for 1 to 30 days, for the purpose of moving a vehicle into, out of, within or through Manitoba. Available to Manitoba and non-Manitoba residents.

ART.2 DRIVER LICENCE PREMIUMS and VEHICLE PREMIUM DISCOUNTS

Effective March 1, 2010, Manitoba Public Insurance implemented the Driver Safety Rating (DSR) program as a method of measuring and classifying driver risk. The ART.2 table displays the 2019/20 Driver License Premiums and Vehicle Premium Discounts. For the 2019/20 Application, the Corporation is not proposing any changes to the DSR program. Additional information on Driver License Premiums and Vehicle Premium Discounts are contained in *Part V(ii) DCS Driver Classification System*.

Figure ART-2: 2019/20 Driver License Premiums and Vehicle Premium Discounts

Please see Appendix 4.

MANITOBA PUBLIC INSURANCE

2017/18

UNIVERSAL COMPULSORY AUTOMOBILE INSURANCE

ANNUAL FINANCIAL STATEMENTS

FOR THE FISCAL YEAR ENDED FEBRUARY 28, 2018

RESPONSIBILITY FOR FINANCIAL STATEMENTS

The Universal Compulsory Automobile Insurance Financial Statements are derived from the Manitoba Public Insurance Corporation's (the Corporation) Annual Financial Statements and are considered by management to fairly represent the financial position, results of operations and changes in cash flow for the Universal Compulsory Automobile Insurance line of business (Basic Insurance line of business).

The financial statements are the responsibility of management and are prepared in accordance with International Financial Reporting Standards. The financial information contained in the annual report is consistent with that in the financial statements. The financial statements necessarily include amounts that are based on management's best estimate and judgments which have been reached based on careful assessment of data available through the Corporation's information systems. In the opinion of management, the accounting practices utilized are appropriate in the circumstances and the financial statements fairly reflect the financial position and results of operations of the Corporation.

In carrying out its responsibilities, management maintains appropriate systems of internal and administrative controls designed to ensure that transactions are accurately recorded on a timely basis, are properly approved and result in reliable financial statements. The adequacy and operation of the control systems are monitored on an ongoing basis by the Internal Audit Department.

The financial statements were approved by the Board of Directors, which has overall responsibility for their contents. The Board of Directors is assisted with this responsibility by its Audit, Finance and Risk Committee (the "Committee"), which consists primarily of Directors not involved in the daily operations of the Corporation.

The general responsibilities of the Committee are categorized into the following: review of financial reporting, review of internal controls and processes, review of actuarial functions, monitoring of corporate integrity, compliance with authorities and review of performance reporting. The Committee's role is that of oversight in these areas in order to ensure management processes are in place and functioning so as to identify and minimize risks to the business operations.

In carrying out the above responsibilities, this Committee meets regularly with management, and with both the Corporation's external and internal auditors to approve the scope and timing of their respective audits, to review their findings and to satisfy itself that their responsibilities have been properly discharged. The Committee is readily accessible to the external and internal auditors.

The Committee is responsible for the review of the actuarial function. As well, the Committee recommends, for approval, the appointment of the external actuary and their fee arrangements to the Board of Directors. The Appointed Actuary is responsible for ensuring that the assumptions and methods used in the valuation of policy and claims liabilities are in accordance with accepted actuarial practice, applicable legislation and associated regulations or directives. In addition, the Appointed Actuary provides an opinion regarding the valuation of policy and claims liabilities at the balance sheet date to meet all policyholder obligations of the Corporation. Examination of supporting data for accuracy and completeness of assets and their ability to meet the policy and claims liabilities are important elements in forming the Appointed Actuary's opinion.

PricewaterhouseCoopers LLP, the Corporation's appointed external auditors, have audited the Basic Insurance financial statements. Their Independent Auditors' Report is included herein. Their opinion is based upon an examination conducted in accordance with Canadian generally accepted auditing standards, performing such tests and other procedures as they consider necessary in order to obtain reasonable assurance that the financial statements are free of material misstatement and present fairly the financial position of the Basic Insurance line of business in accordance with International Financial Reporting Standards.

Independent Auditor's Report

To the Board of Directors of
Manitoba Public Insurance Corporation

We have audited the accompanying financial statements of Manitoba Public Insurance Corporation's Universal Compulsory Automobile Insurance line of business (the financial statements) which comprise the statement of financial position as at February 28, 2018 and the statements of operations, comprehensive loss, changes in equity and cash flows for the year then ended, and the related notes, which comprise a summary of significant accounting policies and other explanatory information.

Management's responsibility for the financial statements
Management is responsible for the preparation and fair presentation of these financial statements in accordance with International Financial Reporting Standards and for such internal control as management determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's responsibility
Our responsibility is to express an opinion on these financial statements based on our audit. We conducted our audit in accordance with Canadian generally accepted auditing standards. Those standards require that we comply with ethical requirements and plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion
In our opinion, the financial statements present fairly, in all material respects, the financial position of Manitoba Public Insurance Corporation's Universal Compulsory Automobile Insurance line of business as at February 28, 2018 and the results of its operations and its cash flows for the year then ended in accordance with International Financial Reporting Standards.

J. S. CHENG & PARTNERS INC

ACTUARY'S REPORT

To the Board of Directors of Manitoba Public Insurance Corporation:

I have valued the Universal Compulsory Automobile Insurance policy liabilities and reinsurance recoverables of Manitoba Public Insurance Corporation for its statements of financial position at February 28, 2018 and their change in the statement of operations for the year then ended in accordance with accepted actuarial practice in Canada including selection of appropriate assumptions and methods.

In my opinion, the amount of policy liabilities net of reinsurance recoverables makes appropriate provision for all policy obligations and the financial statements fairly present the results of the valuation.

Notes to Financial Statements

February 28, 2018

1. Basis of Reporting

Under the provisions of *The Manitoba Public Insurance Corporation Act* and regulations, the Manitoba Public Insurance Corporation (the Corporation) operates an automobile insurance division and a discontinued general insurance division. The lines of business for the automobiles insurance division includes the Basic Universal Compulsory Automobile Insurance (Basic Insurance line of business), extension and special risk coverages. These financial statements represent the Basic Insurance line of business only.

Under *The Drivers and Vehicles Act* (DVA), the Corporation is responsible for DVA operations pertaining to driver safety, vehicle registration and driver licensing, including all related financial, administrative and data processing services.

The Non-Basic lines of business consist of extension, special risk coverages and *The Drivers and Vehicles Act* operations.

The Basic Insurance line of business rates are approved by the Public Utilities Board of Manitoba (Note 26).

The address of the Corporation's registered office is 234 Donald Street, Winnipeg, Manitoba.

Statement of Compliance

The financial statements of the Basic Insurance line of business are presented in accordance with International Financial Reporting Standards (IFRS) as issued by the International Accounting Standards Board (IASB).

The financial statements were authorized for issue by the Board of Directors on May 17, 2018.

The allocation formulas approved by the Corporation's Board of Directors are as follows:

Allocation of Assets, Liabilities and Basic Insurance Retained Earnings
Assets and liabilities are allocated to the Basic Insurance line of business on the following basis:

i. Identifiable direct assets and liabilities are allocated directly to the Basic Insurance line of business.
ii. Other assets and liabilities are allocated to the Basic Insurance line of business bases on factors such as premiums written ratios, expense ratios and claims incurred ratios.

Allocation of Revenue, Claims Incurred and Expenses
Premiums written, premiums earned and claims incurred are allocated directly to the division writing the insurance risk.

Service fees and other revenue are allocated to the Basic Insurance line of business on factors such as premiums written ratios, expense allocation ratios and investment income allocation ratios. The formulas developed for the allocation of service fees and other revenue are approved by the Board of Directors.

Investment income is allocated to the Basic Insurance line of business based on a monthly averaging of the funds available within each division.

Expenses, including claims expense, are allocated to the Basic Insurance line of business on the following basis:

i. Identifiable direct expenses are charged to each line of business.
ii. Where direct allocation is not possible, expenses are prorated to Basic Insurance line of business based mainly on factors such as space, number of employees, time usage, Contact Centre statistics, premiums written ratios and net claims incurred ratios. The basis for allocation of indirect shared expenses is approved by the Board of Directors.
iii. The allocation of improvement initiative costs is based on a review of each project to determine which line of business will benefit from the project. The allocation basis for each project is approved by the Board of Directors.

Appointment of External Actuary
The external actuary is appointed by the Board of Directors of the Corporation. With respect to preparation of these financial statements, the Appointed Actuary is required to carry out a valuation of the insurance contract liabilities and to report thereon to the Corporation's Board of Directors. Insurance contract liabilities include unearned premiums and unpaid claims and adjustment expenses.

The Appointed Actuary also uses the work of the external auditors in their verification of the information prepared by the Corporation used in the valuation of the insurance contract liabilities.

Appointment of External Auditors
The external auditors are appointed by the Lieutenant Governor in Council to conduct an independent and objective audit of the financial statements of the Corporation in accordance with Canadian generally accepted auditing standards. In carrying out their audit, the external auditors also make use of the work of the Appointed Actuary and their report on the Corporation's insurance contract liabilities. The external auditors' report outlines the scope of their audit and their opinion.

Basis of Presentation

The Basic Insurance line of business presents its Statement of Financial Position in order of liquidity.

The following balances are generally classified as current: cash and cash equivalents, investments, due to/from other insurance companies, accounts receivable, prepaid expenses, reinsurers' share of unpaid claims, accounts payable and accrued liabilities, unearned premiums and fees and provision for employee current benefits.

The following balances are generally classified as non-current: investment property, property and equipment, deferred development costs, financing lease obligation, provision for employee future benefits and provision for unpaid claims.

These statements are presented in thousands of Canadian dollars which is the Corporation's functional and presentational currency except as otherwise specified.

Seasonality

The automobile insurance business, which reflects the primary business of the Basic Insurance line of business, is seasonal in nature. While net premiums earned are generally stable from quarter to quarter, underwriting income is typically highest in the first and second quarter of each fiscal year and lowest in the fourth quarter of each fiscal year. This is driven mainly by weather conditions which may vary significantly between quarters.

Basis of Measurement

The Corporation prepares its financial statements as a going concern, using the historical cost basis, except for financial instruments and insurance contract liabilities and reinsurers' share of unpaid claims. Measurement of the financial instruments is detailed in Note 2. Insurance contract liabilities and reinsurers' share of unpaid claims are measured on a discounted basis in accordance with accepted actuarial practice (which in the absence of an active market provides a reasonable proxy for fair value) as explained in Note 2.

Estimates and Judgments

The preparation of financial statements requires management to make estimates and judgments that affect the reported amounts of assets and liabilities, disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses during the reporting period. Actual results could differ materially from these estimates.

2. Summary of Significant Accounting Policies

This summary outlines those accounting policies followed by the Corporation that have a significant effect on the financial statements.

Adoption of New and Amended Accounting Standards

Effective March 1, 2017, the Corporation adopted the following new and amended accounting standards:

IAS 7 – Statement of Cash Flows
In January, 2016, IAS 7 was amended to clarify that entities shall provide disclosures that enable users of financial statements to evaluate changes in liabilities arising from financing activities, including both changes arising from cash flows and non-cash changes. The Corporation has adopted these amendments on March 1, 2017 and has determined that there were no significant impacts to the financial statements.

Annual Improvement Cycles
The annual improvements cycle for 2014–2016 was issued in December 2016 by the IASB and included minor amendments to IFRS 12 *Disclosure of interests in other entities*. The Corporation has adopted these amendments on March 1, 2017, and has determined that there were no significant impacts to the financial statements.

Investments

Funds available for investments are managed by the Manitoba Department of Finance, on behalf of the Corporation, in accordance with Section 12(1) of *The Manitoba Public Insurance Corporation Act*.

The Corporation's directly held real estate investments are recorded at cost and are being depreciated over their estimated useful life.

The Corporation has classified or designated its financial assets and liabilities in the following categories:
- available for sale (AFS)
- held to maturity (HTM)
- financial assets and liabilities at fair value through profit or loss (FVTPL)
- loans and receivables
- other financial liabilities

The Corporation accounts for the purchase and sale of securities using settlement date accounting.

i) AFS Financial Assets
AFS financial assets are initially measured at fair value on the Statement of Financial Position starting on the settlement date. Subsequent to initial recognition, AFS assets are carried at fair value with changes in fair value recorded in OCI until the asset is disposed of, or has become impaired. As long as an AFS asset is held and not impaired, the gains and losses are not recognized in the Statement of Operations. When the asset is disposed of, or has become impaired, the gain or loss is recognized in the Statement of Operations and the amount is deducted from OCI.

Transaction costs related to AFS financial assets are capitalized on initial recognition.

ii) HTM Financial Assets
HTM financial assets are carried at amortized cost on the Statement of Financial Position starting on the settlement date.

Transaction costs related to financial assets and liabilities classified as HTM are capitalized on initial recognition, when applicable.

iii) FVTPL Financial Assets

FVTPL financial assets are carried at fair value on the Statement of Financial Position starting on the settlement date and the changes in fair value are recorded in the Statement of Operations.

The fair values of FVTPL bonds including federal, provincial, certain municipal, certain hospitals, other provinces and corporations are estimated based on bid prices of these or similar investments.

Transaction costs related to FVTPL financial assets are recognized in the Statement of Operations on initial recognition.

Loans and Receivables

Accounts receivable and due from other insurance companies are designated as loans and receivables and are carried at amortized cost using the effective interest method. These receivables include financing plans for customers using interest rates set at the prime rate of the Corporation's principal banker plus 2.0 per cent and updated at each fiscal quarter. The interest rate for a customer remains unchanged throughout the term of the policy.

Cash and Cash Equivalents

Cash and cash equivalents are comprised of cash, current operating accounts, provincial short term deposits (less than 90 days at the time of purchase) and funds held in trust on behalf of other insurance companies and are designated as AFS.

Impairment of Financial Assets

Financial assets, other than those at FVTPL, are assessed for indicators of impairment at the end of each reporting period. Financial assets are considered to be impaired when there is objective evidence that, as a result of one or more events that occurred after the initial recognition of the financial asset, the estimated future cash flows of the investment have been affected.

For equity investments classified as AFS, a significant or prolonged decline in the fair value of the security below its cost is considered to be objective evidence of impairment.

For all other financial assets, objective evidence of impairment could include:

- Significant financial difficulty of the issuer or counterparty; or
- Default or delinquency in interest or principal payments; or
- The lender, for economic or legal reasons relating to the borrower's financial difficulty, granting to the borrower a concession that the lender would not otherwise consider; or
- It is becoming probable that the borrower will enter bankruptcy or financial reorganization; or
- The disappearance of an active market for that financial asset because of financial difficulties; or
- Observable data indicating that there is a measurable decrease in the estimated future cash flows from a group of financial assets since the initial recognition of those assets, although the decrease cannot yet be identified with the individual financial assets in the group.

For financial assets carried at amortized cost, the amount of the impairment loss recognized is the difference between the asset's carrying amount and the present value of estimated future cash flows, discounted at the financial asset's original effective interest rate.

When an AFS asset is considered to be impaired, cumulative gains or losses previously recognized in OCI are reclassified to profit or loss in the period. Subsequent declines in value continue to be recorded through profit and loss.

With the exception of AFS equity instruments, if, in a subsequent period, the amount of the impairment loss decreases and the decrease can be related objectively to an event occurring after the impairment was recognized, the previously recognized impairment loss is reversed through profit or loss to the extent that the carrying amount of the investment at the date the impairment is reversed does not exceed what the amortized cost would have been had the impairment not been recognized.

In respect of AFS equity securities, impairment losses previously recognized in profit or loss are not reversed through profit or loss. Any increase in fair value subsequent to an impairment loss is recognized in OCI.

Derecognition of Financial Assets
The Corporation derecognizes a financial asset only when the contractual rights to the cash flows from the asset expire, or when it transfers the financial asset and substantially all the risks and rewards of ownership of the asset to another entity. If the Corporation neither transfers nor retains substantially all the risks and rewards of ownership and continues to control the transferred asset, the Corporation recognizes its retained interest in the asset and an associated liability for amounts it may have to pay. If the Corporation retains substantially all the risks and rewards of ownership of a transferred financial asset, the Corporation continues to recognize the financial asset and also recognizes a collateralized borrowing for the proceeds received.

Financial Liabilities
All financial liabilities are designated as other financial liabilities and are recorded in the Statement of Financial Position at amortized cost. Financial liabilities include:

- Due to other insurance companies and Accounts payable and accrued liabilities which are all current liabilities; and
- Financing lease obligation which is a non-current liability, payable over the life of the lease.

The carrying value of the Corporation's financial liabilities approximates their fair value.

Derivatives
The Corporation uses currency swaps to manage the currency risk on specific foreign exchange denominated assets. Any gains or losses are recorded in the Statement of Operations under the heading "Investment income," on a fair value basis.

A currency swap is a contractual agreement for specified parties to exchange the cash flow of one currency for a fixed cash flow of another currency.

Fair Value Determination
The fair values of financial instruments are obtained from external pricing services and are based on bid prices for financial assets. Cash equivalent investments comprise investments due to mature within 90 days from the date of purchase and are carried at fair value. Refer to Note 3 for further information on the fair value of financial instruments.

Deferred Policy Acquisition Costs

To the extent premium acquisition costs such as commissions and premium taxes are recoverable from unearned premiums, they are deferred and amortized to income over the term of the related policies.

Property and Equipment

Property and equipment are stated at cost less accumulated depreciation and accumulated impairment losses. Replacement costs are capitalized when incurred and if it is probable that future economic benefits associated with the item will flow to the Corporation and the cost of the item can be measured reliably. All repairs and maintenance costs are recognized in net income (loss) during the period in which they occur.

Depreciation is provided on a straight-line basis which will depreciate the cost of each asset to its residual value over its estimated useful life:

Land & Building

• HVAC systems	20 years
• land improvements	25 years
• roofing systems	30 years
• elevators/escalators	30 years
• buildings	40 years

Furniture & Equipment

• computer equipment	3 years
• vehicles	5 years
• furniture and equipment	10 years
• demountable wall systems	10 years

Buildings held under a long-term lease arrangement are depreciated on a straight-line basis over 40 years. Leasehold improvements are carried at cost and are depreciated over the term of the lease plus the first renewal period. Depreciation of construction in progress will begin, in accordance with the above policy, when construction has been completed. Land is not subject to depreciation and is carried at cost.

Investment Property

In the determination of what constitutes investment property relative to property and equipment, the Corporation has considered the intended use of the property, the ability to sell the property, and the ability of the Corporation to lease the property or a portion of the property under a finance lease.

The Corporation's investment property, which is property held to earn rentals and/or capital appreciation, is measured initially at its cost, including transaction costs. The Corporation has elected to use the cost model to subsequently value its investment property. Therefore, the investment property's carrying amount is valued at cost less accumulated depreciation and impairment losses. Depreciation is based on the useful life of each component of the investment property along with the property's residual value. The Corporation assesses its investment property for impairment on an annual basis in accordance with the impairment test guidance set forth in IAS 36, *Impairment of Assets*.

Depreciation is provided on a straight-line basis which will depreciate the cost of each asset to its residual value over its estimated useful life:

- HVAC systems 20 years
- roofing systems 30 years
- elevators/escalators 30 years
- buildings 40 years

Tenant improvements are carried at cost and are depreciated over the term of the lease plus the first renewal period. Depreciation of construction in progress will begin, in accordance with the above policy, when construction has been completed and the investment property is deemed available for use. Land is not subject to depreciation and is carried at cost.

Deferred Development Costs (Intangible Assets)

The costs of developing major information systems that are expected to provide an economic benefit to the Corporation are deferred to future periods. These information system expenditures are stated at cost net of accumulated amortization and accumulated impairment losses and are amortized on a straight-line basis over five years.

An internally-generated intangible asset arising from development (or from the development phase of an internal project) is recognized if, and only if, all of the following have been demonstrated:

- the technical feasibility of completing the intangible asset so that it will be available for use or sale;
- the intention to complete the intangible asset and use or sell it;
- the ability to use or sell the intangible asset;
- how the intangible asset will generate probable future economic benefits;
- the availability of adequate technical, financial and other resources to complete the development and to use or sell the intangible asset; and
- the ability to measure reliably the expenditure attributable to the intangible asset during its development.

The amount initially recognized for internally-generated intangible assets is the sum of the expenditure incurred, including directly assigned employee costs, from the date when the intangible asset first meets the recognition criteria listed above. Where no internally-generated intangible asset can be recognized, development expenditures are recognized in income or loss in the period in which they are incurred. Subsequent to initial recognition, internally-generated intangible assets are reported at cost less accumulated amortization and accumulated impairment losses.

Impairment of Tangible and Intangible Assets (Other Than Financial Assets)
When specific events or circumstances arise, the Corporation reviews the carrying amount of its tangible and intangible assets to determine whether there is any indication that those assets have suffered an impairment loss. If any such indication exists, the recoverable amount of the asset is estimated in order to determine the extent of the impairment loss (if any). Where the asset does not generate cash flows that are independent from other assets, the Corporation estimates the recoverable amount of the cash generating unit to which the asset belongs.

Recoverable amount is the higher of fair value less costs to sell and value in use. In assessing value in use, the estimated future cash flows are discounted to their present value using a discount rate that reflects current market assessments of the time value of money and the risks specific to the asset for which the estimates of future cash flows have not been adjusted.

If the recoverable amount of an asset is estimated to be less than its carrying amount, the carrying amount of the asset is reduced to its recoverable amount. An impairment loss is recognized as an expense immediately.

Where an impairment loss subsequently reverses, the carrying amount of the asset or cash generating unit is increased to the revised estimate of its recoverable amount, but so that the increased carrying amount does not exceed the carrying amount that would have been determined had no impairment loss been recognized for the asset in prior years. A reversal of an impairment loss is recognized as income immediately.

Leasing

Leases are classified as finance leases whenever the terms of the lease transfer substantially all the risks and rewards of ownership to the lessee. All other leases are classified as operating leases.

Manitoba Public Insurance as a Lessee
Assets held under finance leases are initially recognized as assets of the Corporation at their fair value at the commencement of the lease or, if lower, at the present value of the minimum lease payments. The corresponding liability to the lessor is included in the Statement of Financial Position as a finance lease liability.

Lease payments are apportioned between finance expenses and reduction of the lease obligation so as to achieve a constant rate of interest on the remaining balance of the liability.

Operating lease payments are recognized as an expense on a straight-line basis over the lease term, except where another systematic basis is more representative of the time pattern in which economic benefits from the leased asset are consumed.

Manitoba Public Insurance as a Lessor
Manitoba Public Insurance leases retail, office and parking space in cityplace properties, a building and parking facilities owned by Manitoba Public Insurance. All of these leases are considered operating leases.

Revenue

Premiums
Written premiums comprise the premiums on contracts commencing in the fiscal year. Earned premiums represent the portion of written premiums earned through the year on a prorata basis by way of insurance coverage. Written and earned premiums are stated gross of commissions and premium taxes payable and are reported on a gross basis and net of amounts ceded to reinsurance companies.

Unearned Premiums
The liability for unearned premiums is the portion of premiums that relate to the unexpired term of each insurance contract.

Interest Revenue
Interest revenue is recognized when it is probable that the economic benefits will flow to the Corporation and the amount of revenue can be measured reliably. Interest revenue is accrued on a time basis, by reference to the principal outstanding and at the effective interest rate applicable, which is the rate that exactly discounts estimated future cash receipts through the expected life of the financial asset to that asset's net carrying amount on initial recognition.

Investment Income
Investment income is recorded as it accrues. Dividend income from investments is recognized when the Corporation's rights to receive payments is established. Dividend income on common and preferred shares is recorded on the ex-dividend date. Distributions on pooled funds are recorded on the income distribution date. Gains and losses are determined and recorded as at the trade date, and are calculated on the basis of average cost. The effective interest rate method is used to amortize premiums or discounts on the purchase of bonds.

Realized Gains and Losses
The realized gain or loss on disposal of an investment is the difference between the proceeds received, net of transaction costs, and its original cost or amortized cost as appropriate.

The realized gain or loss on disposal of property and equipment is the difference between the proceeds received, net of transaction costs, and its original cost or depreciated cost as appropriate.

Unrealized Gains and Losses
Unrealized gains or losses represent the difference between the carrying value at the year-end and the carrying value at the previous year-end or purchase value during the year, less the reversal of previously recognized unrealized gains or losses in respect of disposals during the year.

Provisions

Provisions are recognized when the Corporation has a present obligation (legal or constructive) as a result of a past event, it is probable that the Corporation will be required to settle the obligation, and a reliable estimate can be made of the amount of the obligation.

The amount recognized as a provision is the best estimate of the consideration required to settle the present obligation at the end of the reporting period, taking into account the risks and uncertainties surrounding the obligation. Where a provision is measured using the cash flows estimated to settle the present obligation, its carrying amount is the present value of those cash flows.

When some or all of the economic benefits required to settle a provision are expected to be recovered from a third party, a receivable is recognized as an asset if it is virtually certain that reimbursement will be received and the amount of the receivable can be measured reliably.

Provision for Employee Current Benefits
The provision for employee current benefits includes accruals for vacation pay and sick pay determined in accordance with the Collective Agreement and Corporate policy.

Provision for Employee Future Benefits

Included in the provision for employee future benefits are the pension benefit plan and other benefit plans.

i. Pension Benefit Plan

The employees of the Corporation are members of a defined benefit pension plan administered under *The Civil Service Superannuation Act.* Included in the accounts is a provision for the employer's future pension liability calculated on an indexed basis. The provision for pension is actuarially determined on an annual basis using the projected benefit method prorated on services. The actuarial present value of the accrued pension benefits is measured using the Corporation's best estimates based on assumptions relating to market interest rates at the measurement date based on high quality debt instruments, salary changes, withdrawals and mortality rates. Changes in experience gains and losses are recognized in the current period. Current service costs and interest costs are recognized in net income in the current period. Actuarial gains and losses are recognized in OCI in the current period.

The Corporation values its pension benefit plan annually, the most recent valuation is at December 31, 2017. Roll-forward procedures are performed to ensure that the December 31, 2017 valuation is a reliable estimate of the valuation at February 28, 2018.

ii. Other Benefit Plans

Other benefit plans consist of two post-retirement extended health plans and severance pay benefits.

The provision for post-retirement extended health benefits is actuarially determined on an annual basis using the projected benefit method prorated on services, which includes the Corporation's best estimates based on assumptions relating to retirement ages of employees and expected health costs. Changes in experience gains and losses are recognized in the current period. Current service costs and interest costs are recognized in net income in the current period. Actuarial gains and losses are recognized in OCI in the current period.

Employees of the Corporation are entitled to severance pay in accordance with the Collective Agreement and Corporate policy. The provision for severance pay is actuarially determined on an annual basis using the projected benefit method prorated on services, without salary projection, which includes the Corporation's best estimates based on assumptions relating to the proportion of employees that will ultimately retire.

Provision for Unpaid Claims

IFRS 4, *Insurance Contracts* permits the continued use of insurance liability valuation methods previously used under pre-IFRS Canadian Generally Accepted Accounting Principles (GAAP). The Corporation establishes reserves for payment of claims and adjustment expenses that arise from the Corporation’s insurance products. The reserve balance represents the expected ultimate cost to settle claims occurring prior to, but still outstanding as of, the reporting date. There are two categories of loss reserves: (1) reserves for reported losses and (2) reserves for incurred but not yet reported (IBNR) losses. In addition, reserves are set up for internal loss adjustment expenses, which include estimated internal costs and other expenses that are expected to be incurred to finalize the settlement of the losses. The Corporation discounts its liabilities for unpaid claims and includes a provision for adverse deviations. Liabilities for unpaid claims are estimated using the input of assessment for individual cases reported to the Corporation and statistical analyses for the claims IBNR. Claims and adjustment expenses are charged to income as incurred.

All of the Corporation's insurance policies meet the definition of an insurance contract and have been accounted for in accordance with IFRS 4.

Reinsurers’ share of unpaid claims are recognized when the related gross insurance claim is recognized according to the terms of the relevant reinsurance contracts.

Liability Adequacy Test

At each reporting period, insurance liability adequacy tests are performed to ensure the adequacy of the contract liabilities, net of related Deferred Policy Acquisition Costs (DPAC) and Reinsurers' Share of Unpaid Claims. In performing these tests, current best estimates of future contractual cash flows and claims handling and administration expenses, as well as investment income from the assets backing such liabilities, are used. A premium deficiency exists when estimated future claims and related expenses exceed unearned premiums. Any resulting deficiency is recognized first by writing down the DPAC with any remainder recognized as a premium deficiency in unpaid claims.

Salvage and Subrogation

Recoveries from salvage and subrogation are recorded as an offset to claims costs. Expected future subrogation recoveries are included in the provision for unpaid claims.

Structured Settlements

In the normal course of tort claims adjudication, the Corporation settles certain long-term claims losses through the purchase of annuities under structured settlement arrangements with life insurance companies. As the Corporation does not retain any interest in the related insurance contract and obtains a legal release from the claimant, any gain or loss on the purchase of the annuity is recognized in the Statement of Operations at the date of purchase and the related claims liabilities are derecognized. While, the Corporation remains exposed to the credit risk that the life insurance companies may fail to fulfill their obligations, management believes this risk to be remote.

Reinsurance Ceded

Premiums, claims and expenses are reported gross and net of amounts due to and recoverable from reinsurers. Estimates of amounts recoverable from reinsurers on unpaid claims are recorded separately from estimated amounts payable to policyholders.

The reinsurers' share of unearned premiums is recognized as an asset in a manner which is consistent with the method used in determining the unearned premium liability.

Foreign Currency

Monetary items denominated in foreign currencies are adjusted to reflect the exchange rate in effect at the year-end. Revenue and expense items in foreign currencies are translated at the exchange rate in effect at the transaction date. Unrealized gains or losses arising on translation are charged to operations in the current year.

Changes in unrealized foreign exchange currency translation amounts for AFS equity investments are recorded in OCI, and included in accumulated other comprehensive income (AOCI) until recognized in the Statement of Operations.

Comprehensive Income

Comprehensive income consists of net income (loss) from operations and other comprehensive income (loss). Changes in unrealized gains and losses on financial assets classified as AFS are recorded in OCI, and included in AOCI until recognized in the Statement of Operations. Actuarial gains and losses on employee future benefits amounts are recorded in OCI and included in AOCI. AOCI is included on the Statement of Financial Position as a separate component.

Critical Accounting Judgments and Key Sources of Estimation Uncertainty

In the application of the Corporation's accounting policies, management is required to make judgments, estimates and assumptions about the carrying amounts of assets and liabilities that are not readily apparent from other sources. The estimates and associated assumptions are based on historical experience and other factors that are considered to be relevant. Actual results may differ from these estimates.

The estimates and underlying assumptions are reviewed on an ongoing basis. Revisions to accounting estimates are recognized in the period in which the estimate is revised if the revision affects only that period; or in the period of the revision and future periods if the revision affects both current and future periods.

Allowance for Doubtful Accounts

The Corporation must make an assessment of whether accounts receivable are collectible from customers. Accordingly, management establishes an allowance for estimated losses arising from non-payment of accounts receivable.

Deferred Development Costs (Intangible Assets)

Deferred development costs represent a significant portion of ongoing expenditures related to information systems development. Management estimates the expected period of benefit over which capitalized costs will be amortized. The considerations which form the basis of the assumptions for these estimated useful lives include the timing of technological obsolescence and customer service requirements, as well as historical experience and internal plans for the projected use of the information systems.

Provision for Unpaid Claims

With respect to preparation of these financial statements, the Appointed Actuary is required to carry out a valuation of the insurance contract liabilities and to provide an opinion to the Corporation's Board of Directors regarding their appropriateness at the reporting date. The factors and techniques used in the valuation are in accordance with accepted actuarial practice, applicable legislation and associated regulations.

Provisions for unpaid claims and adjustment expenses are valued based on Canadian accepted actuarial practice, which are designed to ensure the Corporation establishes an appropriate reserve on the Statement of Financial Position to cover insured losses with respect to the reported and unreported claims incurred as of the end of each accounting period. The insurance contract liabilities include a provision for unpaid claims and adjustment expenses on the expired portion of policies and of future obligations on the unexpired portion of policies. In performing the valuation of the liabilities for these contingent future events, the Appointed Actuary makes assumptions as to future loss ratios, trends, reinsurance recoveries, investment rates of return, expenses and other contingencies, taking into consideration the circumstances of the Corporation and the nature of the insurance policies.

The assumptions underlying the valuation of provisions for unpaid claims and adjustment expenses are reviewed and updated by the Corporation on an ongoing basis to reflect recent and emerging trends in experience. Sensitivity of these assumptions and the impact on net insurance contract liabilities and equity are fully disclosed in Note 17.

Provision for Employee Future Benefits

The Corporation has a defined benefit pension plan, severance benefit plan and post retirement extended health benefit plans. The determination of expenses and liabilities associated with employee future benefits requires the use of critical assumptions such as discount rates, expected mortality rate, inflation rates, expected salary increases and expected health care cost increases. Due to the nature of the estimates used in the valuation process there is inherent measurement uncertainty within the employee future benefit assumptions. See Note 15 for further details of the significant estimates and changes impacting the current period financial statements.

Fair Value of Level Three AFS and FVTPL Investments

Level 3 assets and liabilities would include financial instruments whose values are determined using internal pricing models, discounted cash flow methodologies, or similar techniques that are not based on observable market data, as well as instruments for which the determination of estimated fair value requires significant management judgment or estimation. See Note 3 for further details of valuation methods and assumptions.

Future Changes in Accounting Policy and Disclosure

Certain new standards, interpretations, amendments and improvements to existing standards were issued by The International Accounting Standards Board (IASB) or International Financial Reporting Interpretations Committee (IFRIC) that are mandatory for annual reporting periods beginning on January 1, 2017 or later periods. The standards that may have an impact to the Corporation are:

IFRS 4 – Insurance Contracts

In September 2016, IFRS 4 *Insurance Contracts* was amended to address concerns regarding the different effective dates of IFRS 9 *Financial Instruments* and the new insurance contracts standard IFRS 17 *Insurance Contracts*. The amendment provides a temporary exemption from applying IFRS 9 for entities whose predominant activity is issuing insurance contracts within the scope of IFRS 4. Alternatively, the amendment provides an option to permit entities that issue insurance contracts to reclassify, from profit or loss to OCI, the volatility arising from financial assets reclassified as FVTPL under IFRS 9 that were not FVTPL under IAS 39 *Financial Instruments: Recognition and Measurement*.

This amendment is effective for annual periods beginning on or after January 1, 2018. Based on the amendments to IFRS 4, the Corporation meets the criteria to defer IFRS 9 and is currently evaluating the impact that this standard will have on its financial statements.

IFRS 7 – Financial Instruments: Disclosures

In December 2011, IFRS 7 *Financial Instruments: Disclosures* was amended to require additional financial instrument disclosures upon transition from IAS 39 *Financial Instruments: Recognition and Measurement* to IFRS 9 *Financial Instruments*. The amendments are effective upon adoption of IFRS 9, which is effective for annual periods beginning on or after January 1, 2018. However, in September 2016, IFRS 4 *Insurance Contracts* was amended to provide an option of a temporary exemption from applying IFRS 9 for entities whose predominant activity is issuing insurance contracts within the scope of IFRS 4. Therefore, qualifying entities will have the option to adopt IFRS 9 upon the adoption of IFRS 17 *Insurance Contracts*. The Corporation will qualify for a temporary exemption; thus, the amended IFRS 7 is effective for annual periods beginning on or after January 1, 2021. The Corporation is currently evaluating the impact that this standard will have on its financial statements.

IFRS 9 – Financial Instruments

IFRS 9 *Financial Instruments* was issued in July 2014 and is intended to replace IAS 39 *Financial Instruments: Recognition and Measurement*. IFRS 9 is a three part standard aimed at reducing complexity in reporting financial instruments. The project has been divided into three phases: Phase 1 *Classification and measurement*, Phase 2 *Impairment* and Phase 3 *Hedge accounting*. Phase 1 was issued in November 2009 and amended in October 2010. It requires financial assets to be recorded at amortized cost or fair value depending on the entity's business model for managing the assets and their associated cash flow characteristics. All financial assets are to be measured at fair value on the balance sheet if they are not measured at amortized cost. At initial recognition, an entity may irrevocably designate a financial asset as measured at FVTPL if doing so eliminates or significantly reduces a measurement or recognition inconsistency that would otherwise arise from measuring assets or liabilities or recognizing the gains and losses on them on different bases.

Phase 2 was completed in July 2014 and introduced a new expected loss impairment methodology that will result in more timely recognition of impairment losses. Phase 3 was completed in November 2013. This phase replaces the rule-based hedge accounting requirements in IAS 39 to more closely align the accounting with risk management activities.

The standard is effective for annual periods beginning on or after January 1, 2018. However, in September 2016, IFRS 4 *Insurance Contracts* was amended to provide an option of a temporary exemption from applying IFRS 9 for entities whose predominant activity is issuing insurance contracts within the scope of IFRS 4. Therefore, qualifying entities will have the option to adopt IFRS 9 upon the adoption of IFRS 17 *Insurance Contracts*. The Corporation will qualify for a temporary exemption; thus, IFRS 9 is effective for annual periods beginning on or after January 1, 2021. The Corporation is currently evaluating the impact that this standard will have on its financial statements.

Note disclosures that both explain how an entity qualified for the temporary exemption and allow for comparison with other entities applying IFRS 9 will be required during the deferral period. The Corporation is evaluating the impact this will have on the financial statements.

IFRS 15 – Revenue from Contracts with Customers

IFRS 15 *Revenue from Contracts with Customers* was issued in May 2014 and is intended to replace IAS 18 *Revenue*, IAS 11 *Construction Contracts* and related IFRICs. The standard was issued as a result of an ongoing project to align revenue recognition between IFRS and U.S. Generally Accepted Accounting Principles. The standard provides a single, principles based five-step model to be applied to all contracts with customers. The standard is effective for annual periods beginning on or after January 1, 2018. IFRS 15 contains a scope exception which excludes insurance contracts within the scope of IFRS 4 *Insurance Contracts* and financial instruments within the scope of IFRS 9 *Financial Instruments*; therefore, this standard will have a limited impact on the Corporation.

IFRS 16 – Leases

IFRS 16 *Leases* was issued in January, 2016 and is intended to replace IAS 17, *Leases* and related IFRICs. This standard was issued as a result of a joint project with the U.S. Financial Accounting Standards Board. This standard provides a single lessee accounting model whereby a lessee recognizes a right-of-use asset and a lease liability for all leases. A lessee may elect to apply an exemption to the standard for: leases with a term of 12 months or less that contain no purchase options; or leases where the underlying asset has a low value. This standard is effective for annual periods beginning on or after January 1, 2019. Early application is permitted if IFRS 15 *Revenue from Contracts with Customers* has also been adopted.

IFRS 17 – Insurance Contracts

IFRS 17 *Insurance Contracts* was issued in May 2017 and will replace IFRS 4 *Insurance Contracts*. The intent of the standard is to establish consistent recognition, measurement, presentation and disclosure principles to provide relevant and comparable reporting of insurance contracts across jurisdictions.

The standard requires entities to measure insurance contract liabilities as the risk-adjusted present value of the cash flows plus the contractual service margin, which represents the unearned profit the entity will recognize as future service is provided. This is referred to as the general model. Expedients are specified, provided the insurance contracts meet certain conditions. If, at initial recognition or subsequently, the contractual service margin becomes negative, the contract is considered onerous and the excess is recognized immediately in the statement of operations. The standard also includes significant changes to the presentation and disclosure of insurance contracts within entities' financial statements.

IFRS 17 is effective for annual reporting periods beginning on or after January 1, 2021. The standard is to be applied retrospectively unless impracticable, in which case a modified retrospective approach or fair value approach is to be used for transition. Early application is permitted where entities have also adopted IFRS 15 *Revenue from Contracts with Customers* and IFRS 9 *Financial Instruments*. The Corporation is currently evaluating the impact that this standard will have on its financial statements.

IAS 40 – Investment Property

In December 2016, IAS 40 *Investment Property* was amended to state that an entity shall transfer a property to, or from, investment property when, and only when, there is evidence of a change in use. A change of use occurs if property meets, or ceases to meet, the definition of investment property. A change in management's intentions for the use of a property by itself does not constitute evidence of a change in use. The amendments are effective for annual periods beginning on or after January 1, 2018. The Corporation does not expect this amendment to impact the financial statements.

Annual Improvements

The annual improvements process is used to make necessary but non-urgent changes to IFRSs that are not included in other projects.

The annual improvement cycle for 2014-2016 was issued in December 2016 by the IASB and included minor amendments to IFRS 1 *First-time Adoption of International Financial Reporting Standards*, and IAS 28 *Investments in Associates and Joint Ventures*. The amendments to IFRS 1 and IAS 28 are effective for annual periods beginning on or after January 1, 2018. The Corporation does not expect these amendments to significantly impact the financial statements.

In December 2017, the IASB issued Annual Improvements Cycle 2015-2017, and included minor amendments to IFRS 3, *Business Combinations,* IFRS 11, *Joint Arrangements,* IAS 12, *Income Taxes,* and IAS 23, *Borrowing Costs.* The annual improvements process is used to make necessary but non-urgent changes to IFRS that are not included in other projects. The amendments issued are all effective for annual periods beginning on or after January 1, 2019. The Corporation is evaluating the impact these amendments will have on the consolidated financial statements.

3. Investments

Cash consists of cash net of cheques issued in excess of amounts on deposit.

Cash equivalent investments have a total principal amount of $71.0 million (February 28, 2017 – $54.5 million) comprised of provincial short-term deposits with effective interest rates of 1.10 per cent (February 28, 2017 – 0.55 per cent), with interest receivable at varying dates.

The Corporation has an unsecured operating line of credit with its principal banker in the amount of $5.0 million (February 28, 2017 - $5.0 million). The unsecured operating line of credit remained unutilized at February 28, 2018 (February 28, 2017 – nil).

* In accordance with approved allocation formulas, items included in the Statement of Operations and Comprehensive Income, are allocated to the Basic Insurance line of business utilizing monthly allocation percentages and the ending asset balances are allocated at the end of the fiscal year. The allocation variance is the amounts required to adjust monthly allocations to the annual balances.

AFS financial assets where the investment's underlying cost is greater than the fair value, the loss has not been recognized in net income either because:

- there is not objective evidence of impairment, or
- the loss is not considered to be significant or prolonged.

Fair Value Measurement

Financial assets that are measured at fair value are classified by their level within the fair value hierarchy. The fair value hierarchy consists of three levels that are defined on the basis of the type of inputs used to measure fair value. The classification cannot be higher than the lowest level of input that is significant to the measurement:

Level 1 – Fair value is determined based on unadjusted quoted prices of identical assets in active markets. Inputs include prices from exchanges where equity and debt securities are actively traded.

Level 2 – Level 2 valuations utilize inputs other than quoted market prices included in Level 1 that are observable, directly or indirectly, for the asset. These inputs include quoted prices for similar assets in active markets and observable inputs other than quoted prices, such as interest rates and yield curves. The fair values for some Level 2 securities were obtained from a pricing service. Pricing service inputs may include benchmark yields, reported trades, broker/dealer quotes and bid/ask spreads.

Level 3 – Fair value measurements using significant inputs that are not based on observable market data are Level 3. This mainly consists of derivatives and private equity investments. In these cases prices may be determined by internal pricing models utilizing all available financial information, including direct comparison and industry sector data. For some investments, valuations are obtained annually. For periods between valuations, management assesses the validity of the valuation for current reporting purposes.

No investments were transferred between levels in 2018 or 2017.

The following table presents financial instruments measured at fair value in the Statement of Financial Position, classified by level within the fair value hierarchy.

As at February 28, 2018 (in thousands of Canadian dollars)	**Level 1**	**Level 2**	**Level 3**

The allocation variance is the amounts required to adjust monthly allocations to the annual balances.

Deferred development costs of $16.2 million (February 28, 2017 - $38.1 million) have not yet been put into use and are currently not being amortized. Impairments of $18.7 million (February 28, 2017 – nil) were recognized during the year and have been recorded in claims expense, loss prevention/road safety expense and operating expense on the Statement of Operations.

9. Due to Other Insurance Companies

Other payables and accrued liabilities	**17,976**	19,301
Balance at February 28	**39,327**	40,443

11. Financing Lease Obligation

The Service Centre built on land in Winnipeg at 1284 Main Street and the land on which it is built are owned by a third-party and are leased to the Corporation. The provisions of the lease include an initial term of 25 years and, at the Corporation's option, three further terms of five years each. In accordance with IAS 17, *Leases*, the land portion has been recorded as an operating lease and the building portion as a financing lease. The details of the financing lease are as follows:

(in thousands of Canadian dollars with the exception of interest rates)	**2018**	2017
Interest rate	**6.70%**	6.70%
Interest rate expense for the year	**215**	221
Financing lease obligations at February 28	**3,125**	3,239

The minimum lease payments are as follows:

	Minimum Lease Payments		Present Value of Minimum Lease Payments	
(in thousands of Canadian dollars)	**2018**	2017	**2018**	2017
Not later than one year	**290**	292	**280**	282
Later than one year and not later than five years	**1,203**	1,196	**1,052**	1,045
Later than five years	**3,909**	4,239	**2,655**	2,794
Total	**5,402**	5,727	**3,987**	4,121

12. Operating Leases

As A Lessee:

The Corporation leases offices in Winnipeg and Killarney. These leases are classified as operating leases in accordance with IAS 17, *Leases*. The lease terms for the offices are all under ten years. Also classified as an operating lease is the land portion of the Service Centre located at 1284 Main Street in Winnipeg. None of the leases are subleased and no contingent rent is payable for any of the lease arrangements.

Non-cancellable operating lease rentals are payable as follows:

(in thousands of Canadian dollars)	**2018**	2017
Not later than one year	**303**	489
Later than one year and not later than five years	**529**	746
Later than five years	**999**	1,166
Total	**1,831**	2,401

During the year ended February 28, 2018, $485 thousand was recognized as an expense for operating leases (February 28, 2017 - $580 thousand) in the Statement of Operations.

As A Lessor:

The Corporation owns the cityplace property located in downtown Winnipeg including the cityplace building, one adjacent parking lot and one adjacent parkade. The cityplace building includes five floors of office space, three floors of parking and two floors of retail space. The Corporation uses approximately 60 per cent of the building for administrative purposes and leases out the remaining 40 per cent. Tenant improvements are 100 per cent investment property and therefore do not factor into the calculation. The leases are all classified as operating leases.

Future minimum lease payments under non-cancellable leases to be received are:

(in thousands of Canadian dollars)	**2018**	2017
Not later than one year	**3,434**	3,231
Later than one year and not later than five years	**6,257**	6,949
Later than five years	**5,421**	5,878
Total	**15,112**	16,058

During the year ended February 28, 2018, income from investment property includes gross rental income from operating leases of $12.3 million (February 28, 2017 - $11.9 million) and gross rental expenses pertaining to operating leases of $9.4 million (February 28, 2017 - $9.2 million). Included in rental income is income contingent on retail sales of $190 thousand (February 28, 2017 - $174 thousand).

13. Unearned Premiums and Fees

(in thousands of Canadian dollars)	**Gross**	**2018 Reinsurers' Share**	**Net**

Unearned fees	3,628	-	3,628
Balance at February 28	472,041	-	472,041

14. Provision for Employee Current Benefits

The provision for employee current benefits includes accrued vacation and sick leave liabilities.

(in thousands of Canadian dollars)	**2018**	2017
Balance at March 1	**16,919**	16,871
Provisions incurred	**11,638**	11,403
Payments	**(11,918)**	(11,355)
Allocation adjustment*	**(6)**	-
Balance at February 28	**16,633**	16,919

* In accordance with approved allocation formulas, items included in the Statement of Operations and Comprehensive Income, are allocated to the Basic Insurance line of business utilizing monthly allocation percentages and the ending asset balances are allocated at the end of the fiscal year. The allocation variance is the amounts required to adjust monthly allocations to the annual balances.

15. Provision for Employee Future Benefits

The Corporation has a defined benefit pension plan, severance benefit plan and post-retirement extended health benefit plan available to eligible employees. The defined benefit pension plan is based on years of service and final average salary whereas the severance benefit plan is based on years of service and final salary.

The Corporation uses an actuarial valuation, on an annual basis, to measure the accrued provision for its benefit plans. The most recent actuarial valuation was conducted by an external actuary as at December 31, 2017, with the next scheduled actuarial valuation being December 31, 2018.

The actuarial valuation is based on the Corporation's best estimate of various economic assumptions. With respect to the demographic assumptions, the Corporation relies on and uses the assumptions adopted by the Civil Service Superannuation Board. The weighted average duration of the defined benefit obligation is 15.4 years (February 28, 2017 – 15.6 years). Results from the most recent actuarial valuations, projected to February 28, 2018 and the corresponding economic assumptions are as follows:

Assumptions:

	Pension Benefit Plan		Other Benefit Plans	
(in thousands of Canadian dollars)	**2018**	2017	**2018**	2017
Discount rate	**3.43%**	3.89%	**3.43%**	3.89%
Inflation rate	**2.00%**	2.20%		
Expected salary increase	**1.50%**	2.00%		
Expected health care cost increase (out of scope)			**5.00%**	4.90%
Expected health care cost increase (in scope)			**2.00%**	2.20%

Change in benefit obligations:

	Pension Benefit Plan		Other Benefit Plans	
(in thousands of Canadian dollars)	**2018**	2017	**2018**	2017
Balance at March 1	**262,568**	244,227	**38,677**	36,982
Current service cost	**10,580**	9,972	**3,569**	3,629
Interest cost	**10,011**	10,156	**703**	678
Benefits paid	**(11,637)**	(9,588)	**(3,676)**	(2,613)
Remeasurement losses recognized in OCI	**23,716**	8,965	**822**	-
Allocation adjustment*	**(3,297)**	(1,164)	**(126)**	1
Balance at February 28	**291,941**	262,568	**39,969**	38,677
Employee contribution for the year	**7,610**	7,587	**-**	-

* In accordance with approved allocation formulas, items included in the Statement of Operations and Comprehensive Income, are allocated to the Basic Insurance line of business utilizing monthly allocation percentages and the ending asset balances are allocated at the end of the fiscal year. The allocation variance is the amounts required to adjust monthly allocations to the annual balances.

Plan Assets

The Corporation has not segregated investment assets to fund the benefit plans. Funding occurs as benefits are paid. The Corporation has established a provision against general assets, equal to the obligation, which is increased to match the increase in its benefit plan liabilities. The interest cost associated with the various benefit plans is based on market interest rates at the most recent valuation date.

Benefit Plan Expenses

	Pension Benefit Plan		Other Benefit Plans	
(in thousands of Canadian dollars)	**2018**	2017	**2018**	2017
Current service cost	**10,580**	9,972	**3,569**	3,629
Interest cost	**10,011**	10,156	**703**	678
Total	**20,591**	20,128	**4,272**	4,307

Sensitivity Analysis

Based on the December 31, 2017 actuarial valuation, changes to the actuarial assumptions would change the benefit obligation as follows:

Pension Benefit Plan

Gain due to discount rate increasing from 3.43% to 4.43% (plus 1.00%)	(46,630)
Loss due to discount rate decreasing from 3.43% to 2.43% (minus 1.00%)	61,137
Loss due to mortality life expectancy at age 65 up one year	5,160
Loss due to inflation indexing (2/3rd COLA) increasing 1.00%	26,646
Gain due to inflation indexing (2/3rd COLA) decreasing 1.00%	(23,573)

Other Benefit Plans

Gain due to discount rate increasing from 3.43% to 4.43% (plus 1.00%)	(3,489)
Loss due to discount rate decreasing from 3.43% to 2.43% (minus 1.00%)	4,665
Loss due to mortality life expectancy at age 65 up one year	446
Loss due to heath care cost inflation indexing increasing 1.00%	4,556
Gain due to heath care cost inflation indexing decreasing 1.00%	(3,485)

Expected maturity analysis of undiscounted pension benefit and other benefit plans:

(in thousands of Canadian dollars)	**Less than a year**	**Between 1 & 2 years**	**Between 2 & 5 years**	**Over 5 years**	**Total**
Pension benefit plan	**8,267**	**9,224**	**33,414**	**472,254**	**523,159**
Other benefit plans	**365**	**412**	**1,518**	**36,336**	**38,631**
At December 31, 2017	**8,632**	**9,636**	**34,932**	**508,590**	**561,790**

(in thousands of Canadian dollars)	Less than a year	Between 1 & 2 years	Between 2 & 5 years	Over 5 years	Total
Pension benefit plan	7,566	8,506	31,153	463,232	510,457
Other benefit plans	333	380	1,422	36,257	38,392
At December 31, 2016	7,899	8,886	32,575	499,489	548,849

16. Insurance Contracts

The following is a summary of the insurance contract provisions and related reinsurance assets as at February 28, 2017 and 2018.

	2018		
(in thousands of Canadian dollars)	**Gross**	**Reinsurance Ceded**	**Net**

Total Insurance Contract Provisions	2,224,612	611	2,224,001

17. Claims Liabilities

Methodology and Assumptions

The best estimates of claim liabilities are determined based on a review of the projected ultimate claim liabilities using various standard actuarial techniques. In particular, the techniques used to project ultimate claim liabilities include the incurred loss development method, the paid loss development method, the incurred Bornheutter-Ferguson method, and the paid Bornheutter-Ferguson method. The projected ultimate claim liabilities are then determined by selection of the most appropriate technique by line of business, coverage, and maturity of the accident year.

Loss Development Method

The loss development method projects ultimate claims for each accident year using the reported/paid losses as at the valuation date, and assuming that future development on these losses is similar to prior accident years' development. The underlying assumption of the method is that the reported/paid-to-date losses will continue to develop in a similar manner in the future.

Bornheutter-Ferguson Method

The Bornheutter-Ferguson Method projects ultimate claims for each accident year by adding the expected unreported/unpaid losses to the reported/paid losses as at the valuation date. The expected unreported/unpaid losses are determined as the product of the expected loss ratio and the per cent unreported/unpaid, the latter based on the maturity of the accident year. An implicit assumption of this method is that the reported/paid-to-date losses contain no informational value as to the amount of losses yet to be reported/paid.

Claim liabilities are initially determined on an undiscounted gross basis. Ceded claim liabilities are then deducted to determine the claim liabilities on an undiscounted net basis.

By line of business and coverage, losses paid and incurred for the last 19 accident years, on a gross basis, are organized in a triangular form by accident year and development period. Adjustments are made to the triangles for comprehensive coverage and indexed coverages:

- For comprehensive coverage, catastrophic losses are removed from the triangles. For the purpose of the valuation, catastrophic losses are defined as losses from a single catastrophic event whereby the incurred losses from the event exceed the Corporation's catastrophe retention level for the applicable accident year. The claim liabilities for these catastrophic losses are evaluated separately.
- For indexed coverages, prior years' losses are brought to current benefit levels so that the loss development factors are unaffected by indexation.

Ratios of loss amounts at successive development years are calculated to build loss development factor triangles. Loss development factors are selected based on observed historical development pattern. Judgment is used whenever there is significant variability in the observed historical development pattern, which happens with coverages with a small number of claims. Judgment is also used, in the absence of available supporting data, to determine tail factors for long-tailed coverages.

The loss data does not include internal loss adjustment expenses (ILAE). As such, a provision for ILAE is determined based on the observed historical ratios of paid ILAE to paid losses. The method assumes that half of the ILAE is paid when the claim is first set up, with the remaining half being paid to maintain the claim. An ILAE ratio is selected based on the observed historical ratios. Half of the selected ratio is applied to case reserves. The full ratio is applied to IBNR losses.

The loss data includes salvage and subrogation. As such, a separate analysis is not performed.

Ceded claim liabilities and net claim liabilities are determined as follows:

- For catastrophe reinsurance, estimates of gross claim liabilities are determined for each catastrophic loss. The net claim liabilities are then determined as the gross claim liabilities less the applicable recovery. The ceded claim liabilities are the applicable recovery.
- For casualty reinsurance, aggregate ceded claim liabilities by insurance year are determined taking into consideration discounting, retention levels, and other contract provisions. These liabilities are deducted from gross claim liabilities to determine net claim liabilities.

The undiscounted claim liabilities are adjusted to determine the discounted claim liabilities on an actuarial present value basis. Two adjustments are made to conform to the Actuarial Standards of Practice of the Canadian Institute of Actuaries:

- The undiscounted claim liabilities are discounted based on a selected discount rate, which is determined based on the market value weighted yield for the Corporation's bond portfolio as at the end of the fiscal year; and
- Provisions for adverse deviation are added to the discounted claim liabilities to obtain the discounted claim liabilities on an actuarial present value basis.

The estimates for unearned premium liabilities are also tested to ensure that they are sufficient to pay for future claims and expenses in servicing the unexpired policies as of the valuation date.

Changes in Assumptions

Change in Discount Rate

The previously selected discount rate, determined based on the average duration weighted yield for the Corporation's bond portfolio, decreased by 7 basis points, from 3.39 per cent to 3.32 per cent, between the February 28, 2017 valuation and the February 28, 2018 valuation. The decrease in the discount rate increased the discounted net claim liabilities by $12.9 million and ILAE provision by $1.4 million.

Change in Loss Development Factors

The loss development factors for all coverages are reviewed and revised to reflect an additional year of actual losses. The aggregate effect of all revisions to the loss development factors is a decrease in the discounted net claim liabilities of $37.8 million and ILAE provision of $6.9 million.

Change in Selected Incurred But Not Reported

In the February 28, 2017 valuation, for both Basic Accident Benefits Weekly Indemnity and Accident Benefits Other (Indexed), the IBNR for the four most recent years were selected as the higher of the indicated IBNR using the incurred Bornheutter-Ferguson method and the paid Bornheuttter-Ferguson method. For the February, 28, 2018 valuation, this "higher of" method was applied to only the three most recent years. This change was made to recognize the change in reserving process for long-term Personal Injury Protection Plan (PIPP) claims, which increased the adequacy of case reserves for these claims, specifically for claims older than 24 months.

The change in the selected IBNR decreased the discounted net claim liabilities by $25.2 million and ILAE provision by $4.6 million.

Change in Claims Margin for Adverse Deviation

The claims margin for adverse deviation (MFAD) are reduced for Basic Accident Benefits Weekly Indemnity and Basic Accident Benefits Other (Indexed). This change was made to recognize the change in reserving process for long-term PIPP claims, which increased the adequacy of case reserves for these claims and decreased the risk of being under reserved.

The change in the claims MFAD decreased the discounted net claims liabilities by $26.9 million and ILAE provision by $2.9 million.

Change in the Basis for Determining the Discount Rate

The discount rate, previously determined based on the average duration weighted yield for the Corporation's bond portfolio, is now determined based on the market value weighted yield for the Corporation's bond portfolio. The change in the basis for determining the discount rate increased the discount rate by 15 basis points from 3.32 per cent to 3.47 per cent as of the February 28, 2018 valuation. This change was made to reduce the mismatch between changes in the Corporation's assets and liabilities resulting from the change in market yields. The change in the basis for determining the discount rate decreased the discounted net claim liabilities by $25.8 million and ILAE provision by $2.7 million.

The provision for unpaid claims, including adjustment expenses, by major claims category includes:

According to accepted actuarial practice, the discounted net claim liabilities include a provision for adverse deviation (PfAD) of $225.6 million (February 28, 2017 – $245.8 million). This is comprised of a claims development PfAD of $152.8 million (February 28, 2017 – $174.9 million), an interest rate PfAD of $72.7 million (February 28, 2017 – $70.9 million), and a reinsurance PfAD of $0.1 million (February 28, 2017 - nil).

Net claims incurred and adjustment expenses included no losses from catastrophes in the current fiscal year (February 28, 2017 – nil). Catastrophes are an inherent risk to the Corporation and may contribute materially to the year-to-year fluctuations in the Corporation's results of operations and financial condition when they occur.

Unpaid claim liabilities are carried at values that reflect their remaining estimated ultimate costs for all accident years.

Development of Ultimate Claims

The following table represents the development of claims on the gross basis as of February 28, 2018.

Gross	Accident Year										
(in thousands of Canadian dollars)	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	10 Year Total
Estimate of ultimate claims costs for the most recent ten years:											
At end of accident year	509,767	538,042	534,691	530,058	565,938	634,333	589,243	681,244	725,741	724,819

Percentage surplus (deficiency) of initial gross reserve	3.6%	2.6%	(4.7%)	(7.3%)	(9.8%)	(0.9%)	(0.1%)	(4.3%)	(3.0%)	0.0%	

There is uncertainty inherent in the estimation process. The actual amount of ultimate claims can only be ascertained once all claims are closed. The unpaid claim liabilities for PIPP benefits represent the majority of the Corporation's claim liabilities. PIPP claim liabilities are also the most uncertain because of the long term nature of these benefits. A 5.00 per cent increase in net PIPP claim liabilities is equal to approximately $60.5 million (February 28, 2017 - $58.2 million). Such a change could occur if the actual future development of lifetime PIPP claimants was higher than expected.

The discount rate for the Corporation's claim liabilities is calculated based on the yield of the Corporation's fixed income portfolio. Approximately two thirds of the fixed income portfolio is composed of marketable bonds and the changes in the marketable bond yield have a direct impact on the estimated value of the Corporation's unpaid claim liabilities. A 1.00 per cent decrease in marketable bond interest rates would increase claim liabilities by approximately $142.6 million (February 28, 2017 - $159.6 million), while a 1.00 per cent decrease in the claim liabilities discount rate (equivalent to approximately 1.35 per cent decrease in marketable bond interest rates) would increase claim liabilities by approximately $194.3 million (February 28, 2017 - $178.3 million). However, this impact would be largely offset by gains on the Corporation's fixed income portfolio as described in the Interest Rate Risk section of Note 24.

18. Reinsurance

The Corporation follows the practice of obtaining reinsurance to limit its exposure to losses. Under agreements in effect at February 28, 2018, these reinsurance agreements limit the Corporation's exposure on a casualty basis to a maximum amount of $5.0 million (February 28, 2017 – $5.0 million) on any one occurrence.

The reinsurance arrangements also limit the Corporation's liability in respect to a series of claims arising out of a single occurrence, including catastrophic claims, to a retained maximum of $15.0 million (February 28, 2017 – $15.0 million). These arrangements protect the Corporation against losses up to $266.7 million (February 28, 2017 – $266.7 million).

19. Capital Management

The Corporation's Board of Directors has approved risk-based capital adequacy target levels by line of business to maintain financial stability.

The Basic Rate Stabilization Reserve (RSR) relates to the basic universal compulsory automobile insurance and is intended to protect motorists from rate increases made necessary by unexpected events and losses arising from non-recurring events or factors.

The Corporation's Board of Directors' current minimum target level for total equity (which includes Basic retained earnings and the Basic portion of AOCI) is $201.0 million (February 28, 2017 - $181.0 million) based on the 2017 Basic Insurance Dynamic Capital Adequacy Test (DCAT) report. In this report, the Corporation's Chief Actuary concluded that a minimum total equity of $201.0 million would be required for Basic to achieve a satisfactory future financial condition. A total equity level lower than $201.0 million results in a "not satisfactory" opinion because there were plausible adverse scenarios at the 1-in-40 year probability level where liabilities exceed assets.

In Order No. 130/17, the Public Utilities Board approved a lower DCAT-based RSR target (for total equity) of $180.0 million and the continued use of the DCAT methodology for this purpose. However, the Corporation's Board of Directors continues to rely on the Chief Actuary's minimum target of $201.0 million as the Public Utilities Board estimate does "not reflect best estimate expectations", as noted on page 78 of Order No. 130/17. Further, a target of $180.0 million is not sufficient to achieve satisfactory financial conditions as calculated by the Corporation's Chief Actuary.

For the upper (maximum) RSR target for total equity, the Corporation proposed the continued use of the 100 per cent Minimum Capital Test (MCT) ratio in the 2018 General Rate Application. The MCT is a capital adequacy test used by nearly all property and casualty insurers in Canada, and at the 100 per cent level, capital available is equal to capital required. The Corporation is the only insurer in Canada that has proposed the use of 100 per cent MCT as a maximum capital target. Other public insurers have utilized 100 per cent MCT as a target capital amount or a minimum capital amount, while federally regulated private insurers have a target capital ratio (supervisory target) of 150 per cent MCT, and a minimum internal target which would be set greater than the 150 per cent supervisory target. In 2017, the Public Utilities Board set the maximum RSR target for total equity at $325 million, which is equivalent to an MCT ratio of approximately 70 per cent.

The below chart depicts the components of the Basic Insurance line of business Retained Earnings.

(in thousands of Canadian dollars)	**Rate Stabilization Reserve (RSR)**	**Retained Earnings (RE)**	**Total Retained Earnings**
Retained earnings as at March 1, 2016	194,497	-	194,497
Net loss from operations for the year	-	(123,070)	(123,070)
Transfer between RSR & RE	(123,070)	123,070	-
Transfer between Non-Basic Retained Earnings & RSR	27,824	-	27,824

(in thousands of Canadian dollars)	**2018**	2017
RSR before transfer from Non-Basic Retained Earnings	**133,675**	71,427
AOCI-Basic (Note 20)	**39,870**	81,749
	173,545	153,176
Transfer from Non-Basic Retained Earnings to RSR	**37,300**	27,824
Basic Target based on total equity	**210,845**	181,000

20. Accumulated Other Comprehensive Income

AOCI reflects the net unrealized gain or loss on financial assets classified as AFS and net actuarial gain (loss) on employee future benefits. Changes in AOCI by type of asset are presented below.

(in thousands of Canadian dollars)	**Equity Investments**	**Other Investments**	**Total AOCI**
Balance at March 1, 2016	61,688	(25,185)	36,503
Items that will not be reclassified to income			
Remeasurement of employee future benefits	-	(8,965)	(8,965)
Items that will be reclassified to income			
Unrealized gains (losses) on AFS assets	89,111	(240)	88,871
Reclassification of net realized losses related to AFS assets	(34,193)	(143)	(34,336)
Allocation adjustment*	1	(325)	(324)
Balance at February 28, 2017	**116,607**	**(34,858)**	**81,749**
Items that will not be reclassified to income			
Remeasurement of employee future benefits	**-**	**(24,538)**	**(24,538)**
Items that will be reclassified to income			
Unrealized gains (losses) on AFS assets	**6,993**	**(118)**	**6,875**
Reclassification of net realized losses related to AFS assets	**(24,034)**	**-**	**(24,034)**
Allocation adjustment*	**-**	**(182)**	**(182)**
Balance at February 28, 2018	**99,566**	**(59,696)**	**39,870**

* In accordance with approved allocation formulas, items included in the Statement of Operations and Comprehensive Income, are allocated to the Basic Insurance line of business utilizing monthly allocation percentages and the ending asset balances are allocated at the end of the fiscal year. The allocation variance is the amounts required to adjust monthly allocations to the annual balances.

21. Service Fees and Other Revenue

(in thousands of Canadian dollars)	**2018**	2017
Transaction fees	**6,365**	6,165
Time payment fees	**2,228**	2,116
Time payment interest	**11,402**	10,439
Late payment fees	**710**	627
Dishonoured payment fees	**512**	523
Other miscellaneous revenue	**1,632**	878
Total	**22,849**	20,748

22. Commitments

As of February 28, 2018, the Corporation has no material commitments.

23. Related-Party Transactions

Key Management Personnel

Key management personnel are comprised of all members of the Board of Directors and the named Executive management team. The summary of compensation of key management personnel for the year is as follows:

(in thousands of Canadian dollars)	**2018**	2017
Short term benefits	**1,586**	1,661
Post-employment benefits	**220**	36
Other long-term benefits	**20**	20
Termination benefits	**31**	43
Total	**1,857**	1,760

Key management personnel and their close relatives may have insurance policies with the Corporation as required by *The Manitoba Public Insurance Corporation Act*. The terms and conditions of such transactions are the same as those available to clients and employees of the Corporation.

Province of Manitoba

Investment management fees paid to the Department of Finance are disclosed in Note 3.

Accounts Payable and Accrued Liabilities includes $533 thousand (February 28, 2017 - $291 thousand) due to the Province of Manitoba.

24. Insurance and Financial Risk Management

Insurance Risk

The Corporation is exposed to insurance risk in that the risk under any one insurance contract creates the possibility that the insured event occurs and there is uncertainty regarding the amounts of the resulting claim. By the very nature of an insurance contract, this risk is random and therefore, unpredictable.

Financial Risk

Investments carry certain financial risks including market risk, credit risk and liquidity risk. In accordance with Section 12(1) of *The Manitoba Public Insurance Corporation Act*, the Minister of Finance is responsible for the investments of the Corporation. The Minister has charged the Department of Finance with the operational management of the fund. The Corporation, through the Investment Committee of the Board, and the Department jointly determine appropriate policies and strategies to mitigate risk. The investment objectives and goals of the Corporation are embodied in an Investment Policy document, which sets target asset allocation and portfolio concentration limits as well as defining the credit quality of the counterparties and the percentage of highly liquid investments required to meet cash flow needs.

Market Risk

Market risk is the risk that changes in foreign exchange rates, market interest rates and other changes in market prices will result in fluctuation of the fair value or future cash flows of a financial instrument.

Currency Risk

Currency risk is the risk that changes in foreign exchange rates will result in fluctuation of the fair value or future cash flows of a financial instrument. The Corporation has low exposure to currency risk because the Corporation has limited non-Canadian financial instruments. As of February 28, 2018, total foreign denominated financial instruments was approximately 7.3 per cent (February 28, 2017 – 7.9 per cent) of the Corporation's investment portfolio and had carrying values noted below.

2018	**2018**	2017	2017
$111.6 million U.S.	**$143.0 million Cdn**	$118.3 million U.S.	$157.1 million Cdn
£7.0 million GBP	**$12.4 million Cdn**	£6.2 million GBP	$10.2 million Cdn
$12.1 million NZD	**$11.2 million Cdn**	$12.0 million NZD	$11.5 million Cdn

The Corporation has entered into a currency swap relating to a Province of Quebec provincial bond denominated in U.S. dollars for $10.0 million. The currency swap provides a fixed 5.76 per cent return in Canadian dollars. The agreement also provides that at predetermined future dates, the Corporation pays a fixed 7.5 per cent rate based on the U.S. $10.0 million par value of the bond and receives 5.76 per cent return based on a Canadian dollar notional value of $13.4 million. As of February 28, 2018 the fair value of the swap was $14.4 million (February 28, 2017 - $15.1 million). The maturity date of the currency swap and the bond is July 15, 2023.

Interest Rate Risk

Interest rate risk is the risk that changes in market interest rates will result in fluctuation of the fair value or future cash flows of a financial instrument.

The market valuation of the Corporation’s fixed income portfolio is directly impacted by fluctuations in interest rates and will have a larger impact on instruments with a long duration.

Bonds	Average Effective Rate - %	
	2018	2017
Federal	**3.13**	2.15
Provincial	**3.00**	2.94
Municipal	**3.30**	3.28
Schools	**4.58**	4.61
Corporations	**3.35**	2.87

The Corporation monitors interest rate risk by calculating the duration of the fixed income portfolio and the duration of unpaid claims liabilities. The duration is an indicator of the sensitivity of the assets and liabilities to changes in current interest rates. The duration of the liabilities is determined by projecting expected cash flows from the contracts using best estimates of morbidity and mortality primarily relating to PIPP claims. The duration of the assets is calculated in a consistent manner. Any gap between the duration of the assets and the duration of the liabilities is minimized by purchasing and selling fixed interest securities in order to adjust the duration of the assets appropriately. As at February 28, 2018, the Corporation’s duration gap was 0.0 years (February 28, 2017 – 0.1 years).

As at February 28, 2018, a 100 basis point increase in interest rates would result in a decrease in the fair value of the Corporation's fixed income portfolio of approximately $114.3 million (February 28, 2017 - $102.6 million), whereas a 100 basis point decrease in interest rates would result in an increase in the fair value of the Corporation’s fixed income portfolio of approximately $137.9 million (February 28, 2017 - $124.8 million). As all of the Corporation’s marketable fixed income assets are classified as FVTPL, all changes would affect net income.

Fluctuations in interest rates would also have an impact on the Corporation's unpaid claims. The Corporation's duration of its fixed income portfolio approximates the duration of its unpaid claims liability and therefore, any change in interest rates related to these investments is largely mitigated by an offsetting impact on the unpaid claims liability. As at February 28, 2018, a 100 basis point increase in interest rates would result in a decrease in the Corporation's unpaid claim liabilities of approximately $118.7 million (February 28, 2017 - $131.2 million), whereas a 100 basis point decrease in interest rates would result in an increase in the Corporation's unpaid claim liabilities of approximately $142.6 million (February 28, 2017 - $159.6 million).

The resulting impact on net income of a 100 basis point increase in interest rates would be an increase of $4.4 million (February 28, 2017 – $28.6 million) whereas a 100 basis point decrease in interest rates would result in a decrease in the net income of $4.7 million (February 28, 2017 – $34.8 million).

Equity Price Risk

The fair value of equity securities held by the Corporation can be affected by changes in market prices, other than currency and interest rate risks, which may be caused by factors specific to the individual financial instrument or factors affecting all similar financial instruments. General economic conditions, political conditions and other factors affect the equity market. As at February 28, 2018, a 10.0 per cent change in the fair value of the Corporation's equity portfolio would result in a $34.9 million (February 28, 2017 - $42.1 million) change in OCI.

As all equities are classified as AFS, all changes in prices are recorded as OCI and do not directly impact the Statement of Operations until such time as an investment is sold or has become impaired (Note 2). The Corporation has policies in place to limit and monitor its exposure to individual issuers and classes of issuers of equity securities.

Credit Risk

Credit risk is the potential for the Corporation to incur a financial loss due to the failure of the other party to discharge an obligation. Financial instruments that give rise to potential credit risk for the Corporation include fixed income securities, accounts receivable, reinsurance receivables and structured settlements.

The following table summarizes the Corporation's maximum exposure to credit risk on the Statement of Financial Position. The maximum credit exposure is the carrying value of the asset net of any allowance for loss.

(in thousands of Canadian dollars)	**2018**	2017
Cash and cash equivalents	**72,998**	61,606
Bonds	**1,611,917**	1,486,589
Due from other insurance companies	**2**	16
Accounts receivable	**389,186**	353,523
Reinsurance receivable	**1,190**	522
Maximum credit risk exposure on the Statement of Financial Position	**2,075,293**	1,902,256

Fixed Income Securities Credit Risk

The Corporation mitigates its exposure to credit risk by placing fixed income securities with high-quality institutions with investment grade ratings. The credit quality of financial assets that are neither past due nor impaired can be assessed by reference to external credit ratings, where available, or to historical information about counterparty default rates. The following table highlights the fixed income securities by credit quality according primarily to Moody's Investors Service at February 28. All Manitoba municipal, schools and hospitals bonds are backed by the Province of Manitoba and, as such, have been assigned the credit rating of the Province of Manitoba Bonds.

	2018		2017	
	Carrying Value (in thousands of Canadian dollars)	**Percentage of Portfolio**	Carrying Value (in thousands of Canadian dollars)	Percentage of Portfolio
AAA	**160,050**	**9.9**	203,759	13.7
AA	**1,341,173**	**83.2**	1,259,967	84.8
A	**110,694**	**6.9**	22,863	1.5
Total	**1,611,917**	**100.0**	1,486,589	100.0

Accounts Receivable Credit Risk
The Corporation's accounts receivable are comprised of customers with varying financial conditions as the Corporation is required to provide basic insurance to all vehicle owners and drivers in the Province of Manitoba. All significant past due receivables, including subrogation receivables, are fully provided for due to the uncertainty of collection. Substantially all remaining receivables are deemed to be collectible within 12 months. The credit risk pertaining to premiums receivable is mitigated as a customer's policy may be cancelled for default of payment.

The following table highlights the Corporation's accounts receivable by major category.

(in thousands of Canadian dollars)	**2018**	2017
Policy and time payments	**312,213**	287,287
Accrued interest	**22,646**	22,072
Subrogation and other receivables	**73,195**	64,018
Allowance for doubtful accounts	**(18,868)**	(19,854)
Balance at February 28	**389,186**	353,523

Details of the allowance for doubtful accounts are as follows:

(in thousands of Canadian dollars)	**2018**	2017
Balance at March 1	**19,854**	16,994
Accounts written off	**(4,259)**	(1,790)
Current period provision	**3,273**	4,650
Balance at February 28	**18,868**	19,854

Reinsurance Receivable Credit Risk
The Corporation evaluates the financial condition of its reinsurers to minimize the exposure to significant losses from reinsurer insolvency. The Corporation holds collateral in regards to unregistered reinsurance in the form of amounts on deposit and letters of credit of which there were $0.2 million outstanding as of February 28, 2018 (February 28, 2017 – $0.2 million). Furthermore, a corporate guideline requiring reinsurers to have a minimum credit rating of A- from A.M. Best and BBB+ credit rating from Standard & Poors is in place.

For the 2017/18 fiscal year, twelve reinsurers share the Corporation's casualty reinsurance coverage, ranging from 2.5 per cent to 35.0 per cent on any one layer. The reinsurer exposed to 35.0 per cent of the losses is licensed in Canada by the Office of the Superintendent of Financial Institutions and, therefore, subject to minimum capital requirements.

For the 2017/18 fiscal year, eighteen reinsurers share the Corporation's catastrophe reinsurance coverage, none holding more than 28.25 per cent of the reinsurance exposure on any one layer.

No material amount due from reinsurers was considered uncollectible during 2017/18 and no allowance for doubtful accounts has been established as at February 28, 2018.

Structured Settlements Credit Risk
The Corporation has settled some insurance claims by purchasing structured settlements from life insurers. As of the Statement of Financial Position date, the present value of expected payments totals $129.5 million (February 28, 2017 – $131.9 million) based on various dates of purchase. The Corporation guarantees the future annuity payments to claimants and is thus exposed to a credit risk to the extent any of the life insurers fail to fulfill their obligations. The net risk to the Corporation is the credit risk related to the life insurance companies that the annuities are purchased from. This risk is reduced to the extent of coverage provided by Assuris, the life insurance compensation insurance plan.

Liquidity Risk
A significant risk of the insurance industry is the ability to match the cash inflows of the investment portfolio with the cash requirements of the policy liabilities and operating expenses. The Corporation has taken the overall historical liability settlement pattern as a basis to define diversification and duration characteristics of the investment portfolio. To meet the cash requirements for claims and operating expenses, the Corporation has policies to ensure that assets and liabilities are broadly matched in terms of their duration.

Cash and cash equivalents are essential components of the Corporation's financial liquidity management. Cash flows are monitored to ensure sufficient resources are available to meet our current operating requirements. Excess funds not needed to meet current operating requirements are invested in long-term instruments to generate additional revenue for future obligations.

	1,519,821	1,502,554
Net asset due after one year	**747,311**	678,980

26. Rate Regulation

Under the provisions of *The Crown Corporations Governance and Accountability Act*, the Public Utilities Board has the authority to review and approve Basic Insurance rates, premiums and service fees charged with respect to compulsory driver and vehicle insurance provided by the Corporation. No new rates or fees for services can be introduced without the approval of the Public Utilities Board. This business comprises approximately 87 per cent (February 28, 2017 - 88 per cent) of the total business based on net claims incurred.
