[1] No IBNR assumed prior to 2024 AY, Ultimate loss set as incurred loss.
[2] Ultimate loss calculated as incurred + IBNR.
[3] IBNR provided by reinsurance team with 91.5% allocation to Basic LOB.
[4] Paid and Incurred DFM are calculated and compared to reinsurance teams analysis. This ensures consistency in the analysis

[1] Catastrophe segment includes events with total claims related to hail, flood, and windstorm over $2M incurred or 1000 reported claims (between all lines of business).
[2] Catastrophes not identified for years prior to 1997.
[3] Catastrophes identified as of the December 2024 valuation date, and historical triangles may not be reflective of all events which would be identified at prior valuation dates.

[1] Catastrophe segment includes events with total claims related to hail, flood, and windstorm over $2M incurred or 1000 reported claims (between all lines of business).
[2] Catastrophes not identified for years prior to 1997.
[3] Catastrophes identified as of the December 2024 valuation date, and historical triangles may not be reflective of all events which would be identified at prior valuation dates.

[1] Catastrophe segment includes events with total claims related to hail, flood, and windstorm over $2M incurred or 1000 reported claims (between all lines of business).
[2] Catastrophes not identified for years prior to 1997.
[3] Catastrophes identified as of the December 2024 valuation date, and historical triangles may not be reflective of all events which would be identified at prior valuation dates.

[1] Catastrophe segment includes events with total claims related to hail, flood, and windstorm over $2M incurred or 1000 reported claims (between all lines of business).
[2] Catastrophes not identified for years prior to 1997.
[3] Catastrophes identified as of the December 2024 valuation date, and historical triangles may not be reflective of all events which would be identified at prior valuation dates.

[1] Full weight put on Incurred BF method for 2007 and after, full weight put on incurred loss development method for years prior to 2007.
[2] Note Paid methods are very different from the Incurred methods. This appears to be due to Paids coming in much higher than expected. We reached out to claims and they believe we are realizing
our ultimate sooner due to operational efficiencies with most of the development occurring between 15 and 30 months.

This pivot table needs to be updated each quarter to verify the allocation to lines of business.

The incurred losses in this table are from C:\Users\mpicost\Manitoba Public Insurance\Capital Management Team - Reinsurance\Reporting\Catastrophe Reporting\Triangles for Valuation\3.31.2025.

data below for Steinbach flood is as of September 26

September Flood Storm Comparison

Sept 16-17, 2024
- 222 claims reported in the first 2 weeks (238 total)
- Average Incurred $7,062
- Total Incurred $1,680,709
- Total Loss - 51%

Sept 11-12, 2025 (Still developing)
- 80 claims reported in the first 2 weeks
- Average Incurred $14,686
- Total Incurred $1,174,846
- Total Loss – 78%

1. For items with orange highlighting, these have different formulas as this information comes from a different query. Claims that have no estimates have no claim count so they are ran in a separate report.
2. The claim counts in this table are verified to the Hail Dashboard. See Validation worksheet for more information.
3. Column (8) average loss or ultimate severity was derived using the development factor method with additional salvage ratio applied (see Assumption worksheet).

1. Seasonality provided by Valuation team. For Catastrophes, the seasonality is 100%.
2. Incurred Loss, Paid Loss and Case Reserves are as of the latest development period (week) which may vary by a few days from the valuation date. The losses in the chart above are based on the latest week whereas the losses shown on the "Summary" worksheet are as of the valuation date.

Complete this sheet after "1. CAT IBNR - Direct" is done as the Direct losses are needed to determine the recoveries.

1. Column (9) Reinsurance Recoveries Received means that MPI has billed the reinsurers, not necessarily collected the cheque. This is consistent with the GL.
2. MPI does not have full participation in first and third layer of Cat treaty. If AAD is exceeded, then recoveries will need to be adjusted for this.

2 - Change in Ultimate Recovery Estimates

(6) Calculated ULAE Ratio	14.00%		
(7) Case Outstanding at December 31, 2025	1,684,987		
(8) Total IBNR at December 31, 2025	638,885		
(9) Estimated Unpaid ULAE at December 31, 2025 using Total IBNR	207,393		

Notes:
[a] PIPP Enhancement has been removed for all paid and case in prior years. In the current year it is include b/c PIPP lines have PIPP Enhancement rolled up. This does not have a material impact on the ratio using the current selection method.
[b] Starting in March 2023 expenses used were based on IFRS 17. The diffrences between IFRS 4 and IFRS 17 expenses in March 2023 was not material
[c] Ratio unchanged from March selection.

Report on the Valuation of Actuarial and Other Policy Liabilities Manitoba Public Insurance Corporation, as at 31 March 2026 Universal Compulsory Automobile Insurance

Dear Satvir/Cara:

Enclosed is a copy of my Report on the Valuation of the Actuarial and Other Policy Liabilities as of March 2026 for the Universal Compulsory Automobile Insurance operations of Manitoba Public Insurance ("MPI" or "the Company"). This is for inclusion with your annual P&C 1 return, for your external auditor, and your own internal use. You are also required to forward a PDF copy of the report to The Public Utilities Board of Manitoba (PUB).

Yours sincerely,

Cosimo Pantaleo, FCIA

1 Scope of Report

1.1. Introduction

The Board of Directors of Manitoba Public Insurance Corporation ("MPI" or "the Company") has engaged Cosimo Pantaleo as the Company's Actuary.

One of the duties of your Appointed Actuary is to annually value the actuarial and other policy liabilities of the Company. This report summarizes the methodologies and assumptions used by your Appointed Actuary to value the liabilities of the company as of 31 March 2026.

This valuation was performed by Ernst & Young LLP ("EY") under the direction of Mr. Pantaleo. Mr. Pantaleo is a Fellow of the Canadian Institute of Actuaries and of the Casualty Actuarial Society. Mr. Pantaleo is available to answer any questions regarding this report and can be reached at the following address:

Ernst & Young LLP
Insurance and Actuarial Advisory Services
EY Tower
100 Adelaide Street West
Toronto, ON M5H 0B3
Phone: (416) 943-3730
E-Mail: Cosimo.Pantaleo@ca.ey.com

For purposes of this report, actuarial and other policy liabilities[1] were reviewed in detail for both insurance contracts and reinsurance contracts held. Liabilities pertaining to net of reinsurance contracts held are generally established as the difference between direct and ceded policy liabilities.

The valuation has been prepared according to accepted actuarial practice ("AAP") in Canada. Accepted actuarial practice is defined in the professional actuarial standards of practice of the Canadian Institute of Actuaries ("CIA"), augmented by additional regulatory requirements such as those outlined in the Office of the Superintendent of Financial Institution's ("OSFI") Memorandum to the Appointed Actuary. Accepted actuarial practice in Canada requires all actuarial and other policy liabilities recognize both the time value of money and
a risk adjustment.

[1]Policy liabilities are composed of liability for incurred claims (fulfilment cash flows related to past service allocated to the groups of contracts at that date), and liability for remaining coverage (future obligations related to the unexpired portion of policies).

1.2. Use and Distribution

This report and the opinions and conclusions contained herein were prepared for the internal use of the Company and were based on confidential information supplied by the Company. This valuation has been performed for the preparation of financial statements at year-end. It is not intended nor necessarily suitable for any other purpose.

This report will be submitted to the Public Utilities Board of Manitoba ("PUB") and other insurance regulators. We understand this report will be provided, in its entirety, to the Company's external auditors.

No further distribution of this report may be made without the prior permission of MPI and Ernst & Young LLP. The Company and its Appointed Actuary should be notified immediately following any requests for disclosure of any part of this report. Should the report be disclosed, it must be provided in its entirety and recipients advised that the author is available at their cost to discuss the report.

2 Executive Summary

This valuation of actuarial and other policy liabilities has been conducted in accordance with International Financial Reporting Standards and accepted actuarial practice in Canada.

We have made use of historical data and other quantitative and qualitative information supplied by the Company to estimate the future cash flows. We have reviewed this information for reasonableness and internal consistency but without independent audit or verification except as noted herein. We have received a satisfactory response from the Company's auditor regarding the testing of the records, data, and other information requested to ensure accurate and proper recording of information and completeness of data. These checks are described in further detail in the Use of Auditor's Work section.

To estimate the actuarial and other policy liabilities, we have relied on incurred and paid loss data triangles, reported claim counts, as well as the level of earned premiums recorded each year. Projected future claim reporting and payments were based upon the Company's historical experience, supplemented where deemed appropriate, by patterns drawn from other available sources. The value of the actuarial and other policy liabilities represents our best estimate based on the information available to us at the time of our valuation. However, being estimates, they can vary since the actual value is subject to events yet to occur. In our judgment, we have employed techniques and assumptions that are appropriate and the conclusions presented herein are reasonable.

The results of our valuation are summarized in the following tables by reserving line of business and subsequently by portfolio.

Gross / Insurance Contracts Issued by Valuation Line						
($000s)	Case Outstanding	Undiscounted IBNR	Indexation Provision	Discounting	Risk Adjustment	Total Unpaid
Bodily Injury	20,215	10,799		-2,587	1,257	29,683
Accident Benefits (AB)						
Weekly Indemnity	841,684	336,598	565,880	-883,601	23,398	883,959
Other (Indexed)	528,288	204,380	294,087	-473,144	35,237	588,847
Other (Non-Indexed)	46,942	19,763		-4,855	4,295	66,144
Collision	128,344	91,965		-2,827	16,617	234,100
Comprehensive	35,808	37,582		-1,460	5,436	77,366
Property Damage	22,758	24,479		-1,145	1,779	47,872
ULAE	0	230,638		-91,375	7,051	146,315
Total	1,624,039	956,204	859,967	-1,460,994	95,070	2,074,286

The discount rates used to calculate the present value of future cashflows were developed based on a top-down approach using a reference portfolio and removing credit risk. The Quantile approach is used to calculate the risk adjustment for non-financial risk.

Compared to the prior valuation, the ultimate undiscounted estimates have developed as follows (negative indicates favourable):

			Mar-25		Development	
March 2025 & prior ($000s)		Mar-26	Mar Val.	AB Adj.	Mar Val.	AB Adj.
Gross	Bodily Injury - Basic	90,885	90,418	90,418	468	468
	Property Damage - Basic	798,119	794,765	794,765	3,354	3,354
	Collision - Basic	6,788,319	6,794,566	6,794,566	-6,247	-6,247
*	Comprehensive - Basic	1,943,180	1,924,646	1,924,646	18,534	18,534
**	Accident Benefits - Weekly Indemnity	1,933,403	1,882,185	1,931,978	51,219	1,425
**	Accident Benefits - Other (Indexed)	1,445,733	1,444,868	1,452,505	865	-6,772
	Accident Benefits - Other (Non-Indexed)	592,356	583,881	583,881	8,475	8,475
	Total	13,591,996	13,515,328	13,572,759	76,668	19,237
Net	Bodily Injury - Basic	90,885	90,418	90,418	468	468
	Property Damage - Basic	798,119	794,765	794,765	3,354	3,354
	Collision - Basic	6,788,319	6,794,566	6,794,566	-6,247	-6,247
*	Comprehensive - Basic	1,767,318	1,760,904	1,760,904	6,414	6,414
**	Accident Benefits - Weekly Indemnity	1,924,710	1,878,114	1,927,908	46,595	-3,199
**	Accident Benefits - Other (Indexed)	1,440,450	1,442,012	1,449,649	-1,562	-9,199
	Accident Benefits - Other (Non-Indexed)	592,356	583,881	583,881	8,475	8,475
	Total	13,402,157	13,344,659	13,402,090	57,497	66

*Comprehensive coverage includes attritional and catastrophe losses
**Accident benefit coverages AB-WI and ABO-I include PIPP enhancements

When comparing to the prior valuation, a significant portion of the unfavorable development is coming from the indexed Accident Benefits lines, most notably Weekly Indemnity. This is attributable to the change to termination rate assumptions.

Estimates were recalculated as of March 31, 2025, using the updated termination rate assumptions. Under this consistent-methodology comparison, the level of unfavorable development in the indexed Accident Benefits lines is significantly lower, indicating that the majority of the development is driven by the assumption change rather than a deterioration in underlying loss experience.

The primary factor contributing to the remaining unfavorable development is the Comprehensive valuation line mainly the attritional losses, where the loss experience for the 2023 and 2024 accident years have been worse than anticipated along with increasing severity on the Accident Benefits – Other (Non-indexed) line.

Additionally, it is important to note that the ultimate loss estimates for the Accident Benefit valuation lines are based on current indexation levels.

The Liability and Asset for Remaining Coverage amounts were calculated by management. The table below summarizes the results.

Liability for Remaining Coverage - Insurance Contracts Issued	
Net Opening Balance	282,382
Insurance Revenue	-1,321,739
Amortization of Insurance Acquisition Cash Flows	0
Investment Components	0
Net Finance (Income) Expenses from Insurance Contracts	0
Effect of Movement in Exchange Rates	0
Premiums Received for Insurance Contracts	1,363,574
Insurance Acquisition Cash Flows	0
Net Ending Balance excluding Loss Component	324,217
Loss Component	0
Net Ending Balance	324,217

Asset for Remaining Coverage - Reinsurance Contracts Issued	
Net Opening Balance	-3
Allocation of Reinsurance Premium Paid	-27,462
Amortization of Reinsurance Acquisition Cash Flows	0
Investment Components	0
Effect of Changes in Non-Performance Risk of Reinsurers	0
Net Finance (Income) Expenses from Reinsurance Contracts Held	0
Effect of Movement in Exchange Rates	0
Premiums Paid	27,465
Reinsurance Acquisition Cash Flows	0
Net Ending Balance excluding Loss Recovery Component	0
Loss Recovery Component	0
Net Ending Balance	0

Shape the future with confidence

3 Expression of Opinion

I have valued the policy liabilities of Manitoba Public Insurance Corporation for its Basic line of business financial statements prepared in accordance with International Financial Reporting Standards for the year ended 31 March 2026.

In my opinion, the amount of policy liabilities is appropriate for this purpose. The valuation conforms to accepted actuarial practice in Canada and the financial statements fairly present the results of the valuation.

Signature of Appointed Actuary	June 24, 2026 Date opinion was rendered
Cosimo Pantaleo, FCIA Printed Name of Appointed Actuary	Toronto, Ontario Location Opinion was rendered

4 Supplementary Information Supporting the Opinion

The liability for incurred claims (LIC) results on a gross and net basis are derived by valuation line of business throughout Appendices A through D and Exhibits 1-13. The results are summarized in Exhibit 1.

The table below summarizes the LIC and AIC compared to the Company's financial statements.

Liability for Incurred Claims (LIC) ($000s)	AA Estimate	Company Financials
LIC excluding Payables and Receivables	2,089,756	2,089,756
Net Claims Payables / (Receivables)		47,755
Ending Balance		2,137,510

Asset for Incurred Claims (AIC) ($000s)	AA Estimate	Company Financials
AIC excluding Payables and Receivables	26,513	26,513
Net Claims (Payables) / Receivables		1,055
Ending Balance		27,568

5 Data

5.1 Data Sources

In developing this report, EY has made use of historical data and other quantitative and qualitative information supplied by the Company. In particular MPI supplied data on direct paid and unpaid claims, direct written, earned and unearned premiums, and unallocated loss adjustment expenses and operating expenses.

We have reviewed this information for reasonableness and internal consistency but without independent audit or verification except as noted herein. The accuracy of our results is dependent on the accuracy and completeness of this data. Therefore, any material discrepancies discovered in this data should be reported and, if warranted, this report amended accordingly.

The Company has established a number of accounting policies and assumptions which are used in our valuation. We have relied on management inputs in our work such as:

- the choice of yield curves for discounting;
- grouping of lines into portfolios;
- target return assumptions;
- expense allocations.

We have reviewed management's position papers outlining their policy decisions and based on their qualifications, competence, integrity and objectivity do not take issue with their assessments.

5.2 Use of Auditor's Work

We have asked of the Company's external auditor, PricewaterhouseCoopers LLP:

1. to employ appropriate tests and sampling of the Company's individual records to ensure accurate and proper recording of information,
2. to employ appropriate tests and sampling to ascertain that proper management controls are in place to ensure completeness of data,
3. to employ appropriate tests to ensure that our data sets correspond in aggregate to internal company reports,
4. to ensure that reinsurance treaties are properly signed, and
5. to identify any reinsurers who are delinquent in paying accounts.

We expect to receive the auditor's report from PricewaterhouseCoopers LLP before MPI's balance sheet as of March 31, 2026 is finalised. Should we be advised of any material discrepancies, we will revise our report accordingly.

5.3 Reconciliation

We have reviewed the data in our appendices and have reconciled gross and net paid claims, case reserves, and earned premiums to the Company's financial statements. Gross data is reconciled in Appendix A, while financial data is used directly on a ceded basis. Minor differences between our data and the general ledger are not material and do not warrant restatement.

5.4 Claim Data Structure

The Company provided gross and net of reinsurance contracts held claim data for each line of business on both a paid and an incurred basis. The data includes external claim adjustment expenses.

5.5 Rounding

Many figures shown in this report have been rounded to the nearest thousand dollars. Totals and calculations may not agree because of rounding.

6 Assumptions

6.1 Emergence Patterns

To estimate the unpaid losses we have relied on incurred and paid loss data triangles, as well as the level of earned premiums recorded each year. Projected future claim reporting and payments were based upon the Company's historical experience, supplemented where deemed appropriate, by patterns drawn from other available sources.

We have considered the potential impact of environmental changes such as impacts of reforms on settlement patterns as well as the potential for the patterns post COVID-19 to differ from prior experience. Apart from contemplating these specific and known forces, we have assumed business will proceed as it has in the past, with no material changes in settlement procedures or cash flows.

We have not anticipated any extraordinary changes to the legal, social or economic environment (or to the interpretation of policy and treaty language) which might affect the cost, frequency, or future reporting of claims. In addition, our estimates make no provision for potential future claims arising from loss causes not contained in the historical data except in so far as claims of these types are included in the reported losses and are routinely developed.

6.2 Materiality

We have set a precision gauge of $50,000 for data used in our analysis. This is the level of accuracy we expect for data sets and information supplied by the Company. The absolute value of any known errors in the data should not exceed the precision gauge.

In setting a materiality standard, we considered the following amounts:

- the surplus position of the Company,
- the value of the unpaid liabilities, and
- the potential users of the Company’s financial statements.

We’ve also considered the external auditor’s materiality of $40,000,000 for MPI in total. We have adopted a materiality standard of $35,000,000 for Basic and $40,000,000 for MPI in total. This amount is less than 2% of MPI’s estimated total aggregate liability for gross unpaid claims and claim adjustment expenses. If the total value for all actuarial and other policy liabilities is within $35,000,000 of our estimate we do not consider it to be materially different from ours.

This materiality standard is not intended to provide for errors in the estimation process, such as:

> Parameter specification error, including statistical error in the estimation of the parameters, which arises from distortion in the underlying assumptions due to the possible inability of the historical patterns and trends to adequately describe future events; or
>
> Process risk, which is uncertainty associated with the dispersion of the actual outcomes throughout a distribution of possible outcomes.

6.3 Variability of Estimates

The standard of materiality is not a measure of the uncertainty in our estimates. It does not mean that actual results, when all losses are settled, will be within $35,000,000 of our estimate. Actuarial and other policy liabilities are estimates and as such complete assurance cannot be given as to the ultimate accuracy of any recommended level. The value of the actuarial and other policy liabilities represents our best estimate based on the information available to us at the time of our valuation. However, being estimates, they can vary since the actual value is subject to events yet to occur, e.g. the likelihood of claimants bringing suit, the size of awards, or changes in the standards of liability. It should be recognized that future claims emergence may deviate, perhaps materially, from our estimates. In our judgement, we have employed techniques and assumptions that are appropriate, and the conclusions presented herein are reasonable.

The materiality standard is intended to be used as a guideline in determining the significance of any potential errors in this analysis.

6.4 Salvage and Subrogation

The actuarial liabilities in this report are calculated net of anticipated future salvage and subrogation.

6.5 Tariffs

The macroeconomic environment has become increasingly volatile in recent periods as tariffs and counter-tariffs have been introduced at various times and across different products. Although the situation remains fluid, observable impacts directly attributable to these tariff actions have generally been limited to date. While we have not made explicit adjustments for potential tariff effects on claim severity, we consider such impacts to be reflected within our assumptions/methods.

6.6 Labour Interruption

During the 2023/2024 fiscal year, MPI experienced a labour interruption over a period of approximately ten weeks between the end of August and early November. During this time, there was a significant reduction to staff available for claims handling. This impacted MPI's ability to handle claims in a timely manner, leading to a lag in reporting and settlement patterns impacting several coverages, and further exacerbating the claims backlog already present. As a result, the observed loss development factors may be distorted for some coverages. As of March 31, 2025, MPI believes that the claims backlog has effectively caught up to pre-labour interruption levels.

There was no explicit adjustment made to MPIs valuation data to account for the labour interruption, but it was considered when selecting assumptions and methods.

7 Background

7.1 Company Operations

MPI was incorporated as a Crown Corporation in 1971 under the Automobile Insurance Act. In 1974 the Automobile Insurance Act was revised and became the Manitoba Public Insurance Corporation Act. Under the provisions of this Act, MPI operates an automobile insurance division and a discontinued general insurance division.

On March 1, 1994, the province of Manitoba introduced the Personal Injury Protection Plan ("PIPP"). This plan eliminated bodily injury tort actions involving Manitoba drivers within Manitoba and increased payments under no-fault accident benefits coverage. For the coverages affected, we have segregated our analysis into pre-PIPP and PIPP eras.

The Automobile Insurance division provides Basic Insurance, Extension Insurance, and Special Risk Extension (SRE) Insurance coverages. The Basic Insurance package includes third party liability with a $500,000 limit, no-fault accident benefits and all perils coverage with a $750 deductible. Effective April 1, 2026, the Basic Insurance deductible increased from $750 to $1,000. This change does not impact the incurred claims liabilities presented in this report. In addition, MPI writes optional coverage, for example increased liability limits and deductible buy-down coverage in competition with private insurers. This optional coverage is known as "Extension Insurance". Other vehicle insurance coverages not offered by Basic Insurance or Extension Insurance are provided by SRE.

SRE was transferred from the General Insurance division to the Automobile Insurance division on November 1, 1991. The remaining portions of the General Insurance division have been in orderly runoff since 1990. In 2004, all remaining portions of General Insurance division were transferred to the Automobile Insurance division under SRE.

Beginning in 2020, the Corporation changed its year-end to March 31 to coincide with the Government of Manitoba's fiscal year-end.

Ms. Cara Low is the VP and Chief Actuary.

Ms. Satvir Jatana is President & Chief Executive Officer.

Ms. Maria Campos is the VP & Chief Customer and Product Officer and Mr. John Bowering is the VP & Chief Claims Officer.

Only Basic Insurance is the subject of this report.

7.2 Reinsurance

MPI's reinsurance structure consists of the following:

1. Automobile excess of loss casualty treaty of $30 million excess of $20 million.
2. Catastrophe program of $350 million excess of $50 million. The $50 million reflects MPI's retention for all catastrophes related events in a fiscal year. The threshold to be considered as an event is a minimum total loss of $2 million; for the annual aggregate deductible, the contribution layer is $398 million excess of $2 million.
3. Automobile Physical Damage Treaty (SRE only) of $14 million excess of $1 million.
4. Automatic Facultative Agreement of $5 million excess of $5 million which is applicable to only SRE.

The following table shows the general structure of the Automobile Casualty reinsurance coverage applicable from 1994 to present.

Calendar Year	Reinsurance Coverage ($ million)
1994 - 1997	34.0 excess of 1.0
1998	49.0 excess of 1.0
1999 - 2001	74.0 excess of 1.0
2002	73.0 excess of 2.0
2003	38.0 excess of 2.0
2004	47.5 excess of 2.5
2005	47.0 excess of 3.0
2006-2012	45.0 excess of 5.0
2012/13 – 2018/19	45.0 excess of 5.0
2019/20 – 2020/21	40.0 excess of 10.0
2021/22 - 2022/23[1]	40.0 excess of 10.0
2023/24[1,2]	40.0 excess of 10.0
2024/25[1,2]	40.0 excess of 10.0
2025/26	30.0 excess of 20.0

[1] *For SRE & Extension only, the casualty treaty has a $5M excess of $5M coinsurance clause of 31.0% in 2024/25, 22.0% in 2023/24, 22.5% in 2021/22 and 2022/23. Note that Extension was added to the $5M excess of $5M in 2024/25 treaty year.*

[2] *The casualty treaty has a $10M excess of $10M layer with coinsurance clause of 2.50% in 2024/25, 4.50% in 2023/24.*

Starting in the 1994 treaty year, a commutation clause was added. This clause mandated that all open claims for a given treaty year to be collectively settled with the reinsurers for lump sums based on mutually agreed commuted values. To date, MPI has commuted PIPP coverage under its reinsurance treaties through 2006; and is currently in the process of commuting treaty years 2007, 2009, 2011 and 2013. The 2008, 2010, and 2012 treaty years were excluded from the commutation because they currently have no contributing losses. Keeping them open ensures MPI retains coverage in case of future adverse development. Through the commutations process, MPI receives a cash payment equal to the present value of expected future reinsurance recoveries.

Starting 2012/13, the reinsurance contract coverage period was changed from a calendar year basis to a fiscal year basis.

Our valuation of policy liabilities was made on a direct basis and on a net basis after consideration of all reinsurance. The Company advises that currently there is no material amount of uncollectible reinsurance receivable. However, no absolute certainty can be given on the collectability of reinsurance. Contingent liability exists to the extent reinsurance becomes uncollectible.

8 Expenses

Management has completed an expense allocation exercise to determine directly attributable expenses and the allocation among acquisition, policy administration and maintenance costs, and other accordingly. A summary of the exercise has been shared with us and used where applicable in our valuation. The Company has chosen to expense acquisition expenses. The Company has a policy paper explaining their approach and assumptions to allocating expenses. We have reviewed this paper and note:

- No acquisition costs are allocated to future renewals;
- No investment expenses are considered attributable;
- No acquisition cash flows are recognized before contracts, as a result there is no asset for acquisition cash flow and there is no impairment test required.

9 Portfolio Reporting

We have relied on the Company's management to assign each insurance contract written to a Portfolio containing contracts that are subject to similar risks and managed together.

10 Estimates of Future Cash Flows

The estimates of future cash flows consist of claim payments of case reserves and IBNR as well as the adjustment expenses and future inflation adjustments.

Allocated loss adjustment expenses ("ALAE", or external loss adjustment expenses) are embedded in the future claim cash flow estimates. Exhibit 4 shows a calculation to estimate the expected ratio of unallocated loss adjustment expenses ("ULAE") to paid direct claims. It is assumed that ULAE costs are incurred 50% at the time a claim is opened and 50% at time of closing. Consequently 50% of this ratio is applied to direct Case Outstanding to account for closing costs. ULAE costs for claims that have occurred but not yet been reported to the Company and for development on claims that have been reported to the company must also be accounted for. This ratio is also applied to IBNR to provide for ULAE costs associated with IBNR estimates. These assumptions are consistent with the prior year's valuation. In previous valuations, no ULAE reserves was attributed to PIPP Enhancements. However, in the March 2025 valuation, PIPP Enhancements were combined with the corresponding PIPP Non-Enhancement valuation lines. As a result, the ULAE ratio is now applied to the combined PIPP valuation line (e.g. Weekly Indemnity now includes both standard and PIPP Enhancements Weekly Indemnity).

For this valuation, the ULAE ratio was based on claims data from the most recent three years. The latest three years were considered instead of the latest five since paid ULAE amounts changed under IFRS 17 due to revised expense allocation method. The selected ULAE ratio was based on the three year volume weighted average. Fiscal year 2024's paid ULAE is adjusted to remove impacts caused by the write-down of a portion of some deferred development assets related to IT project costs. This was a one-time event and is not expected to affect paid ULAE going forward, so it was excluded from the analysis.

The cashflows for indexed Accident Benefit valuation lines Weekly Indemnity and Other Indexed include a provision for future inflation which varies over the future cashflow periods. The future inflation assumption is expected to be 2.70% in the first cashflow period, followed by 2.50%, 2.36%, and 2.02% for the next 3 periods, and stabilizing at 2.0% for the remaining cashflow periods. The inflation assumption of 1.1% for 2025 is based on Manitoba CPI as of December 31, 2024. The remaining years, where bank forecasts are available, are based on the average of several bank forecasts and are floored at 2.0%. The long-term assumption is floored at 2.0%, reflecting the historical average inflation rate.

There are no other future cash flows contemplated in our estimate for the liabilities for incurred claims.

11 Discount Curve

The discount curve is developed based on the top-down approach using a reference portfolio and removing items that are not aligned with the characteristics of the insurance liability, such as credit risk, from the yield curve. MPI uses the top-down approach which takes advantage of MPI's robust asset-liability management (ALM) practice. In this valuation, the discount rates are expressed as spot rates.

It should be noted that MPI has engaged an external vendor, Addenda Capital, to determine the yield curve. The modelling methodology described in the following sections is based on their models.

11.1 Development of the discount rate under the Top-Down approach

11.1.1 Groupings by liquidity characteristics

The difference in liquidity is the main driver of applying different yield curves. Thus, liquidity is compared across all lines of business. Policyholders cannot easily replace their policies and are not allowed to obtain the exit value in advance of "normal" payment dates. Thus, the liabilities are illiquid across all lines of business. Even though MPI uses separate investment portfolios to support the liabilities by line of business, this approach is not based on differences in the liability portfolios.

The discounting impacts will mainly arise from the Basic line which has the largest volume and much longer duration than Extension/SRE. As such, theoretically, there is little justification for varying yield curves by product type for liquidity characteristics. Also, such differences would be unlikely to have material impacts. Therefore, MPI has chosen to apply a single yield curve for all lines of business.

11.1.2 Selection of a reference portfolio and generation of MPI Blended Yield Curve

There are no specific requirements for the reference portfolio which means it could be based on actual assets held by the company or on a theoretical portfolio of assets. However, choosing a reference portfolio that matches the characteristics of the cash flows (e.g., liquidity and timing of payments), results in a yield curve that is more responsive to changes in the liability portfolios.

The asset portfolio backing Basic line liabilities is considered as a theoretically appropriate and operationally clear and straightforward base for the reference portfolio. This assessment was based on the following key facts:

- The Basic portfolio is the largest, most closely matched asset to liability segment.
- Other portfolios include real estate and equity investments and large parts of those portfolios are held in support of surplus, not liability cashflows.
- Given the previous assessment that liquidity does not significantly vary across portfolios, only one yield curve is needed as the differences between portfolios relates to timing (i.e.

duration), and not currency or liquidity of cash flows. As timing is explicitly reflected via the yield curve's term structure, using the Basic portfolio as the basis for the discount curve is reasonable.

MPI follows the steps below when generating the MPI Blended Curve as implied from the reference portfolio.

Step 1: Create Reference Portfolio

The Reference portfolio is based on the composition of MPI's Basic Claims fixed income portfolio. The reference portfolio weights as at March 31, 2026 are:

Curve Blend	Weight
Federal	5.0%
Provincial	39.0%
Municipal (ONT +30)	20.0%
Corporate AA_A	17.0%
Corporate BBB	19.0%

It should be noted that the Province of Ontario +30bps curve serves as a proxy for the yield curve for municipal bond issues in the Basic claims investment portfolio. The above weights also include commercial mortgages. They are accounted for with a higher allocation to Corporate BBB as a proxy for the increased credit risk since there is no observable curve for commercial mortgages. Additionally, the Basic Claims portfolio includes a 10% allocation to Canadian Real Estate which is excluded from the reference portfolio.

Step 2: Create Component Curves

The component curves are constructed using observable market data for selected constituent securities where the constituent securities are selected based on their characteristics.

Once the securities are selected, a cubic spline methodology is used to solve for a zero-coupon yield curve by fitting a separate cubic polynomial for each interval between two consecutive knots where the knots are the key maturities which correspond to the key rates generally used in finance theory (e.g. 3m, 6m, 1y, etc.). At higher maturities on the yield curve, there may be relative scarcity of bonds so the yield curve is smoothed by incorporating a weighted smoothness penalty. The 12-term[2] and yield parameters are then generated for each curve that best represent the characteristics of that curve for calibration. The spline interpolates each curve to create a 31-term yield curve.

[2] 12-term: 3m, 6m, 1y, 2y, 3y, 5y, 7y, 10y, 15y, 20y, 25y and 30y

Step 3: Create MPI Blended Curve

To create the blended curve, the component curves are weighted using the reference portfolio composition weights from Step 1.

11.1.3 Credit risk adjustment

There is an adjustment to the yield curve to account for credit risk. IFRS 17 B83(b) requires adjustments made to the yield curve to exclude market risk premiums for credit risk, which are relevant only to the assets included in the reference portfolio. The Canadian Institute of Actuaries (CIA) has provided guidance and options on the removal of credit risk if the Top-Down approach is used:

"For debt instruments, the effect of credit risk (if non-trivial) would need to be eliminated from the total bond yield. The effect of credit risk usually comprises two components: the expected credit losses and the unexpected credit losses (i.e., compensation for bearing that risk). The credit risk adjustment includes default risk and downgrade risk."

Addenda Capital determines the expected and unexpected credit adjustment using their proprietary model. More detail regarding the credit risk adjustment methodology can be found in the "IFRS 17 Claims Discount Rate Methodology Paper".

Both expected and unexpected credit adjustments will be removed from the MPI Blended Curve (Section 11.1.2) to create the MPI Yield Curve within the 30-year observable period for discounting purpose.

11.1.4 Market risk and other adjustments

As per IFRS 17.B81, "an entity shall adjust that (reference portfolio) yield curve to eliminate any factors that are not relevant to the insurance contracts."

Even though residual differences in liquidity characteristics of the insurance contracts and the reference portfolio may exist, IFRS 17 does not require that adjustments to be made to the yield curve. Thus, MPI will not apply any additional adjustments other than for credit risk as described in Section 11.1.3.

11.1.5 Observable period

The observable period implied from the reference portfolio and the corresponding credit risk adjustments is 30 years. However, MPI has valuation lines with tails longer than the observable period:

- PIPP Weekly Indemnity (Indexed): lifetime (70 years as proxy)
- PIPP Accident Benefits Other (Indexed): lifetime (70 years as proxy)

Extrapolation of yields into the unobservable period is necessary to allow the discounting of long-tail claims. MPI has elected to use the CIA reference curve in the unobservable period as its reasonable, easy to understand and implement.

11.1.6 Inflation

Indexed fulfillment cash flows will be produced and thus the same single yield curve will be used for discounting without further adjustment for inflation.

11.1.7 Other adjustments

Provision for reinsurance non-performance risk will be calibrated separately and thus will not be adjusted in the discount rate when determining the reinsurance held liabilities.

The derivation of the yield curve methodology is outlined in greater detail in MPI's position paper.

We have calculated the unwinding of discount and impact of change in discount rates to support the Company's insurance finance income/expense results. The unwinding approach followed was the "Constant Yield Curve" as outlined in the Canadian Institute of Actuaries Education Note "IFRS 17 Discount Rates and Cash Flow Considerations for Property and Casualty Insurance Contracts" September 2024. The calculations can be found in Exhibit 6.

12 Risk Adjustment for Non-Financial Risk

The Quantile Approach is used to calculate the risk adjustment.

12.1 Calibration of Risk Adjustments based on Selected Approach

Under the Quantile Approach, a range of claims development scenarios are simulated and the future claims payments of each of the scenarios are discounted to the measurement date. The risk adjustments for non-financial risk are determined as the difference of the discounted unpaid claims at the selected percentile and the best estimate unpaid claims liability averaged across the scenarios.

The Over-Dispersed Poisson (ODP) Bootstrap model is used to simulate the distribution of total discounted unpaid claims across all coverages and lines of business. MPI inputs historical paid claims triangles to the ODP model to create the variabilities of future claims developments in the simulated scenarios. Benefit indexation is also catered though the paid claims triangle.

Paid claims have been selected to input to the model because the data already incorporated indexation, this simplifies the modelling. The Bornhuetter-Ferguson method was selected for the fitted triangle to align with the valuation.

Aggregation of the calculated risk adjustments from coverage level (undiversified) to company level includes a diversification benefit determined using assumed correlations between each coverage and line of business.

Separate undiversified risk adjustments have been calculated for the valuation line Comprehensive catastrophes and for Comprehensive excluding catastrophes as the uncertainty in the future cashflows varies as catastrophes tend to have higher variability. This also impacts the company level diversified risk adjustment since the model assumes that these are two different coverages.

The simulation of discounted unpaid claims also utilizes the following parameters:

- Discount rate used to discount claims payments in each of the simulated scenarios is based on the yield curve derived through the top-down approach.
- Correlation matrix is used between each coverage and line of business. The specification of the matrix is a key assumption based on MPI's book of business:
    - Since SRE is commercial auto, all coverages within SRE are independent of those within Basic and Extension.
    - Since Extension is an add-on to Basic, all respective coverages within Extension are correlated at 0.5 with those same coverages in Basic: Bodily Injury, Property Damage, Collision and Comprehensive. Any coverages within Basic that are not available in Extension are independent.

- Within each line of business, there is an assumption of a 0.25 correlation which was used for coverages within the same line, except for comprehensive, for which no correlation was determined with the other coverages, and for ABO Indexed and ABO Non-Indexed for which a correlation of 0.5 has been selected.

The correlation matrix was determined qualitatively based on nature of the relationship between coverage as quantitative analysis would be difficult to ascertain given the data and amount of effort needed to establish a credible correlation matrix assumption. The correlation-relationship between coverages was classified as medium correlation, represented by a factor of 0.5; low correlation, represented by a factor of 0.25; and no direct correlation which is represented by a factor of zero. Consideration was given to whether high correlation and negative correlation would be appropriate, but such cases were not noted.

- Confidence level selection for the diversified risk adjustment at company level considered two notable items:

  - a higher confidence level produces a higher risk adjustment; and
  - the corporate risk adjustment is not additive since it includes the impact of diversification.

  The Board has reviewed the level of risk adjustment implied at the different confidence levels and determined the 90th percentile confidence level is reasonable and appropriate in providing the level of risk adjustment required by MPI.

The risk adjustment is measured as a percentage of discounted LIC for reporting between full calibration cycles which involves stochastic modelling.

Risk Adjustment Percentages by Valuation Line

The following table shows the Risk Adjustment percentages by valuation line in the current and prior March valuations.

Valuation Line	Mar-25	Mar-26
Basic Third-Party Liability Bodily Injury	4.42%	4.42%
Basic Third-Party Liability Property Damage	3.86%	3.86%
Basic Collision	7.64%	7.64%
Basic Comprehensive Non-Catastrophic	6.43%	6.43%
Basic Comprehensive Catastrophic	9.40%	9.40%
Basic Accident Benefits Weekly Indemnity	2.72%	2.72%
Basic Accident Benefits Other Indexed	6.36%	6.36%
Basic Accident Benefits Other Non-Indexed	6.94%	6.94%
Extension Third-Party Liability Bodily Injury	15.09%	15.09%
Extension Third-Party Liability Property Damage	9.37%	9.37%
Extension Collision	7.07%	7.07%
Extension Comprehensive Non-Catastrophic	4.39%	4.39%
Extension Comprehensive Catastrophic	7.44%	7.44%
SRE Third Party Liability Bodily Injury, Property Damage and Accident Benefits	6.05%	6.05%
SRE Collision and Comprehensive	14.01%	14.01%

Risk Adjustment Calculation for Onerous Assessment and Loss Component Calculation

MPI will continue to assess what refinements can be applied in determining the risk adjustment for calculations used in assessments for onerous contracts. Initially, MPI will apply the same risk adjustment applied in calculating LIC, at the 90th percentile, to assess for onerous contracts.

Ceded Risk Adjustment

Paragraph 64 of IFRS 17 describes the risk adjustment to be determined for ceded reinsurance contracts as the following:

> "an entity shall determine the risk adjustment for non-financial risk so that it represents the amount of risk being transferred by the holder of the group of reinsurance contracts to the issuer of those contracts."

The risk adjustment for the reinsurance held can therefore be conceptually thought of as the difference in the risk position of the entity with (i.e. net position) and without (i.e. gross position) the reinsurance held. The risk adjustments are measured on direct basis. Considering the minimal ceded portion and resulting minimal dollar impact of risk adjustment loadings, MPI assesses it is appropriate to set the ceded risk adjustment percentages equal to the direct risk adjustment percentages.

12.2 Disclosure of Confidence Level

12.2.1 Level of disclosure

As per IFRS 17 requirements, the confidence level corresponding to the risk adjustment results needs to be disclosed. However, the level of disclosure is not strictly limited, thus the entity could determine the level of disclosure appropriate to its business profile.

MPI chooses to disclose the confidence level at company level, in line with IFRS 17 Standard.

12.2.2 Quantification of the Confidence Level

The confidence level will come directly from the selected percentile determined using the Quantile approach for the risk adjustment calculation, as discussed in Section 12.1.

12.3 Aggregation and Disaggregation

12.3.1 Level of Aggregation

For LIC, the risk adjustment will be aggregated to the company level, incorporating diversification credit across the lines of businesses and coverages. The diversified risk adjustment is allocated to coverage level for bottom-up reporting and disclosure purposes based on the relative proportion of each segment's undiversified RA:

$$Diversified\ Coverage\ Level\ RA_{Coverage\ X} =$$

$$\frac{Undiversified\ Coverage\ Level\ RA_{Coverage\ X}}{\sum_i Undiversified\ Coverage\ Level\ RA_i} \times Diversified\ MPI\text{-}total\ RA$$

For purposes of calculating the risk adjustment for internal purposes or between calibrations as a proxy measure, the risk adjustment percentages by coverage can be calculated based on the implied risk adjustment percentage:

$$RA\% = \frac{Risk\ Adjustment}{Discounted\ Unpaid\ Claims\ Liabilities}$$

For onerous assessment, no further diversification credit is allowed for the risk adjustment from the new contract, and the risk adjustment is approximated based on the factor approach.

12.3.2 Disaggregation of Discounting

MPI has elected not to disaggregate insurance finance income and expense and will reflect the entire change in risk adjustment as insurance service.

12.4 Frequency of Risk Adjustment Calculation

MPI will calculate the risk adjustment loadings once per year and the updated risk adjustments will be used for the upcoming year until the next year-end unless material changes indicate that the prior assumptions are no longer relevant.

The risk adjustment amounts on gross and ceded basis are disclosed in Exhibit 5.

13 Liability for Incurred Claims

The liability for incurred claims comprises of the fulfilment cash flows related to past service allocated to groups of contracts at that date. The fulfilment cash flows comprise of the best estimate of future cash flows, an adjustment to reflect the time value of money, and a risk adjustment for non-financial risk. The results presented in this report are prior to the Company's inclusion of payables and other finance driven components of LIC.

13.1 Incurred But Not Reported

Our methodology employed the incurred and paid development techniques (also known as the chain ladder methods), the related Bornhuetter-Ferguson ("B/F") method, the Cape Cod technique, the Loss Ratio technique, and the Claim Frequency/Severity method to estimate the claim liability for incurred but not reported (IBNR) by line on an ultimate undiscounted basis. A more detailed discussion of these techniques (and their underlying assumptions) is given in the Description of Methodologies section.

We performed the analysis on a gross and net basis, with ceded results being calculated as the difference between gross and net. The ultimate undiscounted unpaid case reserves and IBNR amounts were then discounted to recognize the time value of money and a risk adjustment for non-financial risk was estimated following the approaches described in the preceding Discount Curve and Risk Adjustment for Non-Financial Risk sections.

The general approach used to calculate the IBNR for each line of business is outlined below.

13.1.1 Bodily Injury

We selected the ultimate loss estimates based on the incurred B/F method for all insurance years except for the Prior row and the most recent insurance year, where we selected the Incurred Development method. In the March 2025 valuation we selected the incurred B/F method for the most recent insurance year. There has been no other changes in methodology from the 2025 March valuation. The impact is an increase of $2.1M. The selected a priori loss ratio assumption in the B/F method for prior years was unchanged from the March 2025 valuation. Incurred and Paid loss development factors basis of selection were kept the same from the last valuation. Data, loss development factors, and selections are shown direct (equal to net) in Exhibit 7.

13.1.2 Property Damage

We selected the ultimate loss estimates based on the Incurred Development method for all insurance years. The selection changed from the March 2025 valuation where the Incurred B/F method was selected for all insurance years. The selected a priori loss ratio assumption in the B/F method for prior years was unchanged from the March 2025 valuation. Incurred and Paid loss development factors basis of selection basis for early ages were kept the same from the last valuation, until age

51 months. The basis of selection for Paid loss development factors after 51 months were changed from the 3 year Volume Weighted Average to the all year Volume Weighted Average to account for the more volatile development in later periods. Minimum loss development factors were set to 1. The data, loss development factors, and selections are shown direct (equal to net) in Exhibit 8.

13.1.3 Collision

We selected the ultimate loss estimates based on the Incurred Loss Development method for all insurance years. In the March 2025 valuation we selected the Paid Loss Development method for the most recent insurance year. There has been no other changes in methodology from the 2025 March valuation. The selected a priori loss ratio assumption in the B/F method for prior years was unchanged from the March 2025 valuation. Incurred and Paid loss development factors basis of selection were kept the same from the last valuation. The data, loss development factors, and selections are shown on a direct basis (equal to net) in Exhibit 9.

13.1.4 Comprehensive

We selected the ultimate loss estimates, excluding catastrophes, based on the Incurred Loss Development method for all insurance years. This is unchanged from the March 2025 valuation. The selected a priori loss ratio assumption in the B/F method for prior years was unchanged from the March 2025 valuation. Incurred and Paid loss development factors were updated from the last valuation to reflect recent experience with smoothed selections applied where necessary to avoid reversals. The data, loss development factors, and selections are shown direct in Exhibit 10. These selections were made excluding losses from catastrophes[3].

Catastrophe losses are defined to Include hail, windstorm, wildfire, and flood-related losses greater than $2M or an event with 1,000 or more reported claims within four consecutive calendar days. A separate analysis was completed to calculate the ultimate losses from catastrophes. The analysis can be found in Appendix D.

There were 6 major storms in 2023 that were greater than the $2M per occurrence deductible and contributed to the $50M aggregate deductible. The August event was the largest event MPI has seen in the last 20 years and is considered a one-in-twenty-year event. The ultimate cost of that storm on a gross basis is estimated at $180M. Based on MPI's 2023/24 Catastrophe Treaty, the expected reinsurance recovery is $118M. On a direct basis, Basic's ultimate loss is $165M which can be found in Exhibit 10. The ultimate expected recoveries are $107M which can be found in Exhibit 2.

In accident year 2024 there were five major storms that met the definition of a catastrophe. The ultimate cost of the storms are $52M and there is currently no expected recoveries based on MPI's 2024/25 Catastrophe Treaty. Basic's Ultimate loss is $47M which can be found in Exhibit 10.

[3] MPI defines catastrophe as events with total claims related to hail, flood and windstorm over $2M incurred or 1000 reported claims (between all lines of business).

In accident year 2025 there is one major storm that met the definition of a catastrophe. The ultimate cost of the storm is $5M and there is currently no expected recoveries based on MPI's 2025/26 Catastrophe Treaty. Basic's Ultimate loss is $4.5M which can be found in Exhibit 10.

The ultimate loss estimate for catastrophes were calculated with all lines of business combined due to data limitations. However, Basic incurred losses comprises 91.5% of the storms and as such, 91.5% of the IBNR loss was allocated to the Basic line of business.

13.1.5 Accident Benefits – Weekly Indemnity

At each analysis the historical payments and case reserves are restated to reflect current benefit levels prior to performing the analysis. Earned premiums are also restated to match the indexing of the losses. The original incurred and paid data triangles before restatement are shown at the beginning of Exhibit 11.

Ultimate loss estimates for Accident Benefits are calculated using a unified method consisting of multiplicative Loss Development Factors (LDFs) and the generalized Cape Cod method based on exposures and paid losses. Since all insurance years follow this approach, tabular reserving is no longer used to determine ultimate losses.

Following changes to the case reserving methodology via the new calculators, incurred loss experience is no longer a reliable basis for projection due to shifts in case and reporting consistency. The new reserving approach was not applied retroactively. As a result, the analysis relied more heavily on paid losses, which provides a more stable and objective measure.

For Weekly Indemnity, this methodology was applicable to accident years 2005/06 onwards. An assumption of the Cape Cod method is decay rate, which controls how much weight is given to historical loss ratios versus the latest observed ones. The selection of a 50% decay rate reflects actuarial judgment intended to balance stability of long-term loss ratio assumptions and responsiveness to emerging experience. This equal weighting provides credibility to historical and recent experience, which is considered appropriate given the presence of structural changes in case reserving methodology and the potential volatility in recent experience arising from operational disruptions (e.g., backlog effects and labour interruption).

Tail factors applied to all the paid methods. These were selected based on the model that best fits each line, all of which were the inverse power curve. The tail factor selections, which apply after a duration of 33 years, are 1.12 for Weekly Indemnity, 1.14 for PCA paid (1.02 for PCA incurred), and 1.01 for ABOI Other.

For Weekly Indemnity, the B-F method was changed to select a 50:50 weighting on the original "a priori" loss ratios and the loss ratio based solely on the paid developmental method.

13.1.6 Accident Benefits – Other Non-Indexed

We selected the ultimate loss estimate based on the Incurred B/F method for all insurance years after 2007/2008 and the Incurred Loss Development method for years 2007/2008 and prior. The selected a priori loss ratio assumption in the B/F method for prior years was unchanged from the March 2025 valuation. The current insurance year a priori loss ratio is based on the latest forecast for ultimate loss and premiums. Incurred and Paid loss development factors basis of selection were kept the same from the last valuation. The data, loss development factors, and selections are shown direct (equal to net) in Exhibit 13.

13.1.7 Accident Benefits – Other Indexed

Similar to Weekly Indemnity, at each analysis the historical payments and case reserves are restated to reflect current benefit levels prior to performing the analysis. The earned premiums are also restated to match the indexing of losses.

Ultimate loss estimates for Accident Benefits are calculated using a unified method consisting of multiplicative Loss Development Factors (LDFs) and the generalized Cape Cod method based on exposures and paid losses. Since all insurance years follow this approach, tabular reserving is no longer used to determine ultimate losses.

Following changes to the case reserving methodology via the new calculators, incurred loss experience is no longer a reliable basis for projection due to shifts in case and reporting consistency. The new reserving approach was not applied retroactively. As a result, the analysis relied more heavily on paid losses, which provides a more stable and objective measure.

For Other Indexed lines, this methodology was applicable to accident years 2005/06 onwards. An assumption of the Cape Cod method is decay rate, which controls how much weight is given to historical loss ratios versus the latest observed ones. The selection of a 50% decay rate reflects actuarial judgment intended to balance stability of long-term loss ratio assumptions and responsiveness to emerging experience. This equal weighting provides credibility to historical and recent experience, which is considered appropriate given the presence of structural changes in case reserving methodology and the potential volatility in recent experience arising from operational disruptions (e.g., backlog effects and labour interruption).

Tail factors applied to all the paid methods. These were selected based on the model that best fits each line, all of which were the inverse power curve. The tail factor selections, which apply after a duration of 33 years, are 1.12 for Weekly Indemnity, 1.14 for PCA paid (1.02 for PCA incurred), and 1.01 for ABOI Other.

For Indexed Benefits Other, a 50:50 weighting was used on the Incurred and Paid developmental methods for the loss ratios (there is no “a priori” for any of the individual segments).

13.2 Pools and Associations

The Company does not participate in any pools or associations.

13.3 Mass Tort and Environmental Liabilities

We are not aware of any exposure to Mass Tort claims.

13.4 Class Action Suits

We are not aware of any class actions currently pending that involve the Company.

13.5 Payment Patterns

The payment patterns for future cashflows and discounting were based on the Company's own experience. The selected payment patterns and corresponding undiscounted cashflows are shown in Appendix C.

13.6 Comparison of Actual Experience with Expected Experience in Prior Year-End Valuations

Exhibit 3 provides a detailed comparison of the previous valuation report's ultimate undiscounted estimates to the current undiscounted estimates. We have included as many prior valuations as we have performed for the Company up to the previous 10 valuation years. As additional valuations are performed in the future this exhibit will continue to be updated.

Compared to the prior valuation, the ultimate undiscounted estimates have developed as follows (negative indicates favourable development)

			Mar-25		Development ($000s)	
March 2025 & prior ($000s)		Mar-26	Mar Val.	AB Adj.	Mar Val.	AB Adj.
Gross	Bodily Injury - Basic	90,885	90,418	90,418	468	468
	Property Damage - Basic	798,119	794,765	794,765	3,354	3,354
	Collision - Basic	6,788,319	6,794,566	6,794,566	-6,247	-6,247
	Comprehensive - Basic	1,943,180	1,924,646	1,924,646	18,534	18,534
	Accident Benefits - Weekly Indemnity	1,933,403	1,882,185	1,931,978	51,219	1,425

	Total	13,402,157	13,344,659	13,402,090	57,497	66

When comparing to the prior valuation, a significant portion of the unfavorable development is coming from the indexed Accident Benefits lines, most notably Weekly Indemnity. This is attributable to the change to termination rate assumptions.

Estimates were recalculated as of March 31, 2025, using the updated termination rate assumptions. Under this consistent-methodology comparison, the level of unfavorable development in the indexed Accident Benefits lines is significantly lower, indicating that the majority of the development is driven by the assumption change rather than a deterioration in underlying loss experience.

The main material causes of the remaining development come from Comprehensive and Accident Benefits - Other (Non-Indexed).

- For Comprehensive the main drivers are higher than expected severity and frequency for the attritional losses in accident year 2023 and 2024 driven in large part by increases to the cost of glass claims. In addition, there is unfavourable development on direct basis for the 2023 accident year driven by late reported claims attributed to the August 2023 catastrophe event; however, due to recoveries, on a net basis there is minimal prior year development.
- Accident Benefits - Other (Non-Indexed) saw higher than expected incurred loss experience across multiple accident years driven by increasing severity.

13.7 Reinsurance Contracts Held – Non-Performance Risk

The Company's reinsurer(s) are highly rated. There are no recent instances of disputes, significantly overdue reinsurance collectibles, delayed settling of accounts, regulatory restrictions applied to the reinsurer, or poor credit ratings that have been brought to our attention. The risk of non-performance by the reinsurer(s) is thus considered to be relatively minor.

14 Liabilities for Remaining Coverage

Under the Premium Allocation Approach ("PAA"), liability for remaining coverage excluding loss component at initial recognition and at the end of each subsequent reporting period is measured by adjusting premiums received for components such as insurance acquisition cash flows, investment component, etc. The premiums received are allocated on the basis of the passage of time over the coverage period unless otherwise noted.

14.1 Measurement Approach

The Company's contracts are all one year or less in duration thus automatically qualify for PAA eligibility. The Company has chosen to expense acquisition expenses. Management has concluded on whether any contract groups are considered onerous.

The considerations used to determine the groups of insurance contracts used for the purposes of recognizing insurance revenue include:

- Adopting two possible profitability groupings:
  - Onerous at initial recognition; and
  - Others
- Facts and circumstances will be assessed at the group of contracts level; and
- Contracts within the same group cannot be issued more than one year apart as they are written on a losses-occurring-during basis. Contracts within the groups within the portfolios will be further subdivided into annual cohorts based on accident year.

Management concluded no contracts are onerous. We have reviewed both quantitative and qualitative material supporting their decision and do not have concerns with their categorization of whether the groups of contracts are onerous at initial recognition, have no significant possibility of becoming onerous, and the remaining contracts in the portfolio.

14.2 Estimates of Future Cash Flows

The Company has all contracts classified as PAA and no group(s) of onerous contracts. Hence estimates of future cash flows are not required.

14.3 Discounting

14.4

14.5 the Estimates of Future Cash Flows

The Company has all contracts classified as PAA and no group(s) of onerous contracts. Hence the discounting on estimates of future cash flows is not required.

14.6 Risk Adjustment for Non-Financial Risk

The Company has all contracts classified as PAA and no group(s) of onerous contracts. Hence an explicit risk adjustment calculation for the LRC is not required.

14.7 Contractual Service Margin

The Company has all contracts classified as PAA. Hence the measurement of contractual service margin is not required.

14.8 Loss Component

The loss component is estimated as the difference between the expected future on the unexpired portion and the estimated premium received. The Company has all contracts classified as PAA and no group(s) of onerous contracts. Hence the measurement of loss component is not required.

15 Subsequent Event

We are not aware of any events subsequent to 31 March 2026 that are material to our valuation.

16 Other Liabilities/Other Assets

We are not aware of any other liabilities / assets that are not included in the previous sections.

17 Liabilities for Investment and Service Contracts

We are not aware of any liabilities for investment and service contracts as at 31 March 2026 that are material to our valuation.

18 Disclosures

18.1 Annual Reporting Required to the Board or Audit Committee

The results of the March 2026 report were presented to MPI's Audit and Finance Committee on June 24, 2026. The chart below provides a historical summary of the dates on which the valuation reports, including the most recent, were presented to the Committee.

Valuation Report Year	Date Presented to Audit and Finance Committee
March 2024	June 26, 2024
March 2025	June 18, 2025
March 2026	June 24, 2026

18.2 Financial Condition Testing ("FCT") Reporting

MPI prepares a FCT report annually for the Basic Line of Business in compliance to regulatory requirements.

18.3 Continuing Professional Development Requirements

I am in compliance with the Continuing Professional Development requirements of the Canadian Institute of Actuaries.

18.4 Reporting Relationships of the Appointed Actuary

I was engaged by Ms. Cara Low, to act as Appointed Actuary and produce this report for this valuation year. I have discussed findings and this report with Ms. Low.

18.5 Peer Review of the Appointed Actuary

A peer review is not required for this report; however, a peer review will be completed post-release.

19 Description of Methodologies

The choice of a method to estimate losses should consider, among other things, the line of business, number of years of experience, and age of the underwriting or accident year being developed.

19.1 Incurred Loss Development Method

The incurred loss development method is based upon the assumption that the relative change in a given accident year's incurred loss estimates from one evaluation point to the next is similar to the relative change in prior accident years' incurred loss estimates at similar evaluation points. In utilizing this method, actual-historical accident year incurred loss data is evaluated at the end of each calendar year in a triangular fashion and is shown as follows:

Accident Year	Evaluation Point – Measured in Months				
	12	24	36	48	60
2021/22	XXX	XXX	XXX	XXX	XXX
2022/23	XXX	XXX	XXX	XXX	
2023/24	XXX	XXX	XXX		
2024/25	XXX	XXX			
2025/26	XXX				

"Report-to-report" development factors are calculated to measure the relative development of an accident year from one evaluation point to the next. These historical report-to-report-development factors and comparable industry factors are then used to select appropriate report-to-report development factors to use in projecting the incomplete accident years to an ultimate basis.

19.2 Paid Loss Development Method

The paid loss development method is based upon the assumption that the relative change in a given accident year's paid losses from one evaluation point to the next is similar to the relative change in prior accident years' paid losses at similar evaluation points. In utilizing this method, historical evaluations of actual accident year paid losses are made in a manner similar to that shown above for the incurred loss development method.

Report-to-report development factors are then calculated in a manner similar to that described above and selected factors are then used to project the actual paid losses for any given accident year to an ultimate basis.

This method differs from the incurred loss development method in that the company's case loss reserves are excluded from the analysis. This method has the disadvantage of ignoring whatever information is provided by current case loss reserves, but it has the advantage of avoiding the distortions which might be reflected in the incurred loss development method from abnormal reserve increases or decreases.

The results produced by this method are directly dependent upon the amount of paid losses reported to date. The method's implicit assumption is that payment patterns have not changed substantially over time.

19.3 Expected Loss Method

Under the expected loss method, ultimate losses are based upon some prior measure of the anticipated losses, usually relative to some measure of exposure, such as premiums, sales receipts, or payroll. Alternatively, a "frequency/severity" approach entails first estimating the number of claims expected, then multiplying this number by the expected average size of each claim for the coverage year.

Since actual losses do not enter into the calculations, this method has the advantage of stability over time. The ultimate loss estimate does not change unless the premiums or loss ratio are changed. However, this advantage of stability is offset by a lack of responsiveness. In effect, the method ignores actual loss experience as it is reported. This method is based on the assumption that the initial expected losses will essentially materialize as anticipated.

19.4 Bornhuetter-Ferguson Method

The Bornhuetter-Ferguson method is essentially a blend of the incurred loss development and expected loss methods. It combines these two methods by splitting expected losses into two pieces - expected reported and expected unreported. As an accident year matures, the expected reported losses are replaced by actual reported losses and the initial expected loss assumption becomes gradually less important.

Two parameters need to be determined in order to apply the Bornhuetter-Ferguson method: the initial expected loss ratio and the expected reporting pattern.

The loss development factors need to be converted to a basis appropriate for use with expected losses. The factor to be applied to the expected losses is determined as follows:

IBNR factor = 1 - 1 / loss development factor to ultimate.

Therefore, the ultimate losses for an accident year are:

(Expected losses x IBNR factor) + Incurred losses to date

19.5 Benktander Method

The Benktander Method is a credibility mixture of the Bornhuetter-Ferguson and Loss Development method. It is essentially an iteration of the Bornhuetter-Ferguson method, with the initial expected loss ratio assumption being the ultimate loss ratio derived from the Bornhuetter-Ferguson method.

19.6 Cape Cod

The Cape Cod method relies on the loss emergence patterns estimated in the incurred loss development method as well as an appropriate exposure base. In this case the exposure base used is earned premium. The fundamental assumption is that the loss ratio emerged to date applies to the "unreported" exposures. The total reported losses for all years are divided by the total reported exposures for all years to derive an expected ultimate loss-to-exposure ratio. The expected ultimate loss ratio is then applied to the unreported exposure for each year to estimate IBNR reserves.

20 Glossary

Accident Year: Each claim is assigned an accident year based on the calendar year (or fiscal year) in which the claim occurred. Paid and reported claims for any accident year can be evaluated as of any report date. Ultimate incurred claims for each accident year can be estimated by a number of actuarial techniques (see Methods section).

Actuarial and Other Policy Liabilities: Actuarial and Other Policy liabilities is the sum of the liability for incurred claims and liability for remaining coverage.

Case: Refers to the data (premium, claim, ...) carried by the company on individual policy and claim files.

Claim (Loss): The use of the term claim (loss) without modification includes losses and loss adjustment expenses (LAE) which provide for both allocated and unallocated adjustment expenses.

Claim (Loss) Ratio: Ratio of incurred claims to earned premium.

Claims Reserving Techniques: Methods to evaluate the ultimate losses' obligations of the insurer.

Credibility: Measure of the predictive value, which can be attached to a body of data.

Emergence patterns: The delay between the occurrence of the claims and the recording of claims in the insurance system.

Expected Claim (Loss) Ratio: 100% less the acquisition expenses, general expenses and profit margin, all expressed as percentage of premium. It represents the claim ratio expected from a given portfolio assuming no premium redundancy or inadequacy.

External Influences: Consideration should be given to other influences such as judicial environment, regulatory and legislative changes, guaranty funds, economic variables, and residual market mechanisms.

Frequency: The number of claims divided by the number of units.

IBNR: IBNR is the provision for claims incurred but not yet reported. In this report we have used the term in its broader, more general sense, to represent development on outstanding case reserves (also referred to as "supplemental" IBNR reserves) and unreported claims (also referred to as "pure" IBNR).

Liability for Incurred Claims: Liability for incurred claims include all unpaid claims and adjustment expenses (both allocated and unallocated).

Liability for Remaining Coverages: The liability for remaining coverages is the net obligation of the insurance company with respect to its insurance and reinsurance contracts other than the claim liabilities. Generally these liabilities are included in the unearned premium, premium deficiency and deferred policy acquisition expense provisions.

Loss Component: The loss component is the expected underwriting loss on the unearned premium calculated as the excess of expected losses, adjustment expenses and servicing expenses relating to the policies in force over the unearned premiums.

Materiality: Materiality is intended as a guideline in determining the significance of any potential errors in this analysis to the intended reader. The amount of the standard of materiality is not a measure of the uncertainty in our estimates. It is not intended to provide for, or even approximate, errors in the estimation process.

Occurrence based: Provision in contracts covering claims occurring during the term of the contract regardless of the time when they are reported to the insurer.

Reopened Claims Potential: The tendency of closed claims to reopen. Judicial opinions and legislation can affect the reopening of claims, as can changes in an insurer's procedures.

Reported Claims: Reported claims amounts include actual claim payment plus individual unpaid case estimates. They do not include IBNR.

Risk Adjustment: Risk adjustment is the compensation a company requires for bearing the uncertainty about the amount and timing of the cash flows that arises from non-financial risk as the company fulfils insurance contracts.

Settlement Patterns: The length of time that it normally takes for reported claims to be settled.

Severity: Incurred losses divided by the number of incurred claims.

Unallocated Loss Adjustment Expense (ULAE): The costs of closing claim files which cannot be directly attributed to individual claims.
